Wirtz, 2013-06-29 A NATO Advanced Study Institute on Receptors Membrane Transport and Signal Transduction was held on the Island of Spetsai Greece from August 16-27 1988 in order to consider recent developments in membrane receptor research membrane transport and signal transduction mechanisms These topics were put in the larger context of current knowledge on the structure and function of membranes connections between different fields of research were established by in depth discussions of energy transduction and transport mechanisms The general principles of regulation by signal transduction and protein phosphorylation

dephosphorylation were presented in the context of specific cellular processes. Discussions included also the role of protein tyrosine kinases which are structurally related to oncogene products and therefore implicated in various aspects of cell development and transformation. This book presents the content of the major lectures and a selection of the most relevant posters presented during the course of the Institute. The book is intended to make the proceedings of the Institute accessible to a larger audience and to offer a comprehensive account of those topics on receptors, membrane transport and signal transduction that were discussed extensively during the course of the Institute. Selective regulation of G proteins by Cell surface receptors

Transmembrane Receptors and Channels A.G. Lee, 1997-03-11

Volume 6 of Biomembranes covers transmembrane receptors and channels. A particularly important role for the membrane is that of passing messages between a cell and its environment. Part I of this volume covers receptors for hormones and growth factors. Here as in so many other areas of cell biology the application of the methods of molecular biology have led to the recognition of a number of families of receptors. Typically such receptors contain an extracellular ligand binding domain, a transmembrane domain and an intracellular catalytic domain whose activation as a result of ligand binding leads to generation of second messengers within the cell and stimulation of a range of cytosolic enzymes. An alternative signaling strategy exploited in particular in the nervous system is to use ion channels to allow controlled movement of monovalent Na<sup>+</sup> K<sup>+</sup> or divalent Ca<sup>2+</sup> cations in or out of the cell resulting in changes in membrane potential or alterations in the intracellular concentration of Ca<sup>2+</sup>. Part II of this volume is concerned with these ion channels and with other often simpler ion channel systems whose study can throw light on channel mechanism.
