

Molecular Enzymology Lecture 2 (Serine Proteases: Mechanism)

Serine Protease Activation Mechanism (Chymotrypsin)

- The limited proteolysis of the inactive, zymogen form of chymotrypsin, chymotrypsinogen, involves cleavage of the peptide bond between residue 15 and 16

- This cleavage creates a new N-terminus on the now exposed Ile-16 residue
- This N-terminus of Ile-16 is now able to form a salt bridge with the, highly conserved, Asp194 residue in the interior of the protein

- This conformational change puts the NH-groups of residues Gly193 and Ser195 into the correct orientation to form the oxyanion hole

- It also causes the shifting of the residue Met192, opening the substrate specificity pocket
- The four catalytic features of the enzyme are now formed, and the enzyme is active
- The zymogen form of the enzyme contains the catalytic triad and the non-specific binding pocket but NOT the oxyanion hole or the substrate specificity pocket

Molecular Enzymology:

Molecular Enzymology Christopher W. Wharton, 2013-12-11 MOLECULAR ENZYMOLOGY BECAUSE OF ITS CHEMICAL AND MATHEMATICAL content is often regarded as a formidable and forbidding topic by undergraduates on a biology or biochemistry course As a result of teaching enzymology to undergraduates for a number of years we recognize the areas which appear to cause the most common difficulties in conceptual understanding We feel that a book treating those areas by means of a logical approach carefully developed from basic principles fills a gap in the multiplicity of enzymology texts currently available In writing this book we have had in mind the needs of Honours Biochemistry students in particular those who may take a special interest in enzymology The text covers the main bulk of the material required in the second and third years of such courses In addition those taking courses in Biological Chemistry may well find the book to be of central interest The book begins with a description of the fundamentals of catalysis illustrating these with simple chemical reactions which may be supposed to serve as models of catalytic processes Protein structure is discussed in terms of the fundamental forces which determine the shape and dynamic behaviour of protein molecules The approach emphasizes those features thought to be most intimately involved in the catalytic function of enzyme molecules and is illustrated with specific examples
