## **Molecular Pathogenesis Of Diabetes Mellitus:**

Molecular Pathology of Diabetes Mellitus R. D. G. Leslie, 1997 Diabetes already a prevalent disease worldwide is increasing at a rate consistent with a global epidemic The number of people affected is expected to double in the next 15 years to about 200 million The disease is already one of the commonest causes of kidney failure blindness and amputations There is an urgent need to prevent either the development of these complications or the disease itself Dramatic advances in our understanding of the pathogenesis of diabetes have led to the hope that diabetes can indeed be prevented Several major international collaborative projects have been initiated with this aim In this book an outstanding group of international scientists provide a broad outline of the advances in basic science which underpin these projects The book offers a clear comprehensive and up to date account for the interested clinician and scientist and will be invaluable as a reference book for those working in the field

**Molecular Pathology of Type 1 Diabetes Mellitus** Matthias G. Von Herrath, 2001-01-01 Type 1 diabetes as well as multiple sclerosis are thought to be T cell mediated autoimmune diseases that involve a detrimental action of inflammatory cytokines and autoaggressive T lymphocytes They still pose many unsolved puzzles and the precise etiology as well as prevention have remained elusive It is clear that genetic factors can predispose for developing diabetes however based on significant disease discordance found in monozygotic twins additional environmental factors have to be postulated Viruses are good candidates because they induce strong cellular and humoral immune responses but no single etiologic agent has been identified Several animal models are presented which have been used to study the activation of naive autoreactive lymphocytes It is shown that regulation of the autoaggressive process occurs prior to clinical diabetes and is mediated by a complete network of cytokines as well as regulatory circuits cells The spreading of autoimmunity to self antigens not involved in the initial phase of islet destruction is not necessarily detrimental and can carry benefits Therapeutically counter regulation of aggressive responses has been demonstrated via various means in animal models preventing diabetes or rejection of transplanted islets

**Molecular Pathogenesis of MODYs** F. M. Matschinsky, M. A. Magnuson, Massimo Porta, 2000-03-21 A timely collection of research papers by 18 leading scientists in the area of biochemical genetics of diabetes mellitus these contributions focus on a well defined class of monogenic forms of the disease i e MODYs 1 5 all caused by specific mutations or deletion of genes that control pancreatic beta cell functions HNF 4alpha 1 glucokinase 2 HNF 1alpha 3 IDX 1 4 and HNF 1beta 5 This volume offers a historical perspective of MODYs and it also contains contributions which deal with the fundamental questions of pancreas and liver development critical for the understanding of the syndrome complex discussed Attempts have been made to highlight results and concepts that may be relevant for understanding type II diabetes in general exemplified by contributions that connect the field of pancreatic islet cell biology and pathology with the newest findings in the area of insulin action e g the role of the insulin receptor and insulin receptor substrates IRS 1 3 Covering a broad and novel approach on the subject of MODYs this book looks into the future of

molecular genetic and biochemical research in this area It is recommended reading for basic research scientists in the area of diabetes mellitus academically oriented endocrinologists and clinical researchers *Cumulated Index Medicus* ,1988
