## **Molecular And Cellular Basis Of Visual Acuity:**

Molecular and Cellular Basis of Visual Acuity S.R. Hilfer, J.B. Sheffield, 2012-12-06 The Seventh Symposium on Ocular and Visual Development was held in October 1982 The aim of the meeting was to develop a broad perspective on visual acuity The subject was discussed initially in terms of molecular events of photoreception and the metabolism of the photoreceptor elements Subsequent papers presented the development and complexity of the neurocircuitry and transmitter systems in the retina that process the visual information prior to transfer to the brain The meeting concluded with a series of papers on behavioral and physiological methods of measurement of visual acuity in humans particularly young children This volume arose from the papers presented at the meeting We feel that the juxtaposition of research of broadly differing methodologies will be stimulating rather than daunting and will generate an enhanced understanding of this complex subject We are indebted to our colleagues Dr M Mote from Temple University and Drs J Siegfried P Dayhaw Barker and L Press from the Pennsylvania College of Optometry for their expertise and assistance in the organization of the meeting to the speakers for their presentations and contributions to this volume and to the reviewers of the manuscripts for their helpful comments This symposium could not have been held without the generous support of the Temple University College of Arts and Sciences and the Pennsylvania College of Optometry We also thank Merck Sharp and Dohme Inc for their donation

Robbins, M.B. Djamgoz, Anthony Taylor, 2013-06-29 I have been asked to write a brief foreword to this volume honoring Hisako Ikeda providing a review of the accomplishments in our field over the past four decades when Hisako was an active participant This I am delighted to do It has been a most exciting time in vision research and Hisako has been right in the middle of much of the excitement publishing on a wide variety of topics and providing much new data and many new insights

Hisako's research career can be divided by decades into four quite distinct areas of inquiry. In the 1950s as a student in Japan her research interests were psychophysical in nature and she was concerned with visual illusions, figural aftereffects and motion detection. In the 1960s after her move to London she began electrophysiological studies. Much of her work in the 1960s was concerned with the electroretinogram (ERG), its components and the use of this electrical response for evaluating spectral sensitivities of the eye and retinal degenerations. This work represented the beginning of her electrodiagnostic clinical work which continued until her retirement.

[The Retina: A Model for Cell Biology Studies Part 1](#) Ruben Adler, 2012-12-02. The Retina: A Model for Cell Biology Studies Part I is the first of a two-part series that details developments in the study of retinal cell biology. The book begins with some basic information about retinal structure and development followed by a discussion of the advantages of the retina as a model system for cell biology studies. It reviews some of the major events in the maturation of the retina pertinent to the assembly of neuronal circuits. The book describes studies of neuronal assembly in order to demonstrate that adhesion-based neuronal assembly may be the most elaborated example of a wider class of morphogenetic phenomena categorized as adhesion-guided multicellular assembly systems. The remaining chapters discuss in vivo and in vitro studies on trophic interactions in retinal development and in retinal degenerations, cell motility in the retina, molecular properties of vertebrate rod cells, the role of cyclic nucleotides in the metabolism and function of the retina and the cellular and molecular aspects of photosensitive membrane turnover.

**National Library of Medicine Current Catalog** National Library of Medicine (U.S.), 1984. **Cell Interactions in Visual Development** S. Robert Hilfer, Joel Sheffield, 2012-12-06. The eye has fascinated scientists from the earliest days of biological investigation. The diversity of its parts and the precision of their interaction make it a favorite model system for a variety of developmental studies. The eye is a particularly valuable experimental system not only because its tissues provide examples of fundamental processes but also because it is a prominent and easily accessible structure at very early embryonic ages. In order to provide an open forum for investigators working on all aspects of ocular development, a series of symposia on ocular and visual development was initiated in 1973. A major objective of the symposia has been to foster communication between the basic research worker and the clinical community. It is our feeling that much can be learned on both sides from this interaction. The idea for an informal meeting allowing maximum exchange of ideas originated with Dr. Leon Candeub who supplied the necessary driving force that made the series a reality. Each symposium has concentrated on a different aspect of ocular development. Speakers have been selected to approach related topics from different perspectives.

**Sensory Biology of Aquatic Animals** Jelle 1987, Richard R. Fay, William N. Tavalga, 2012-12-06 This volume constitutes a series of invited chapters based on presentations given at an International Conference on the Sensory Biology of Aquatic Animals held June 24-28 1985 at the Mote Marine Laboratory in Sarasota Florida The immediate purpose of the conference was to spark an exchange of ideas concepts and techniques among investigators concerned with the different sensory modalities employed by a wide variety of animal species in extracting information from the aquatic environment By necessity most investigators of sensory biology are specialists in one sensory system different stimulus modalities require different methods of stimulus control and generally different animal models Yet it is clear that all sensory systems have principles in common such as stimulus filtering by peripheral structures tuning of receptor cells signal to noise ratios adaption and disadaptation and effective dynamic range Other features such as hormonal and efferent neural control circadian reorganization and receptor recycling are known in some and not in other senses The conference afforded an increased awareness of new discoveries in other sensory systems that has effectively inspired a fresh look by the various participants at their own area of specialization to see whether or not similar principles apply This inspiration was found not only in theoretical issues but equally in techniques and methods of approach The myopia of sensory specialization was broken in one unexpected way by showing limitations of individual sense organs and their integration within each organism For instance studying vision one generally chooses a visual animal as a model
