

# GENETIC — CHANGES — AND CANCER

## HOW GENETIC INFORMATION CREATES PROTEINS

### PROTEIN

As an mRNA molecule is translated, a chain of amino acids is formed. The chain eventually folds into a three-dimensional protein. The shape of a protein determines its function. Proteins have millions of functions in cells.

## TYPES OF GENETIC MUTATIONS IN CANCER

DNA alterations can affect the structure, function, and amount of the corresponding proteins. All of these effects can change a cell's behavior from normal to cancerous. For example, a genetic alteration can intensify or eliminate the protein's function, which could make cells divide uncontrollably. Many different kinds of genetic mutations are found in cancer cells, including missense, nonsense, and frameshift mutations and chromosome rearrangements.

### MISSENSE MUTATION

|          |                         |                            |                        |                       |
|----------|-------------------------|----------------------------|------------------------|-----------------------|
| Original | CTA<br>LEU<br>(Leucine) | TGG<br>TRP<br>(Tryptophan) | GTA<br>VAL<br>(Valine) | DNA<br>Amino<br>Acids |
| Mutation | CTA<br>LEU<br>(Leucine) | TGG<br>CYS<br>(Cysteine)   | GTA<br>VAL<br>(Valine) | DNA<br>Amino<br>Acids |

A missense mutation is a change of a single DNA base that results in a change in the amino acid sequence. Sometimes a single amino acid change can greatly alter the protein's function.

### NONSENSE MUTATION

|          |                         |                            |                        |                       |
|----------|-------------------------|----------------------------|------------------------|-----------------------|
| Original | CTA<br>LEU<br>(Leucine) | TGG<br>TRP<br>(Tryptophan) | GTA<br>VAL<br>(Valine) | DNA<br>Amino<br>Acids |
| Mutation | CTA<br>LEU<br>(Leucine) | TGA<br>STOP                | GTA<br>VAL<br>(Valine) | DNA<br>Amino<br>Acids |

A nonsense mutation is a change of a single DNA base that creates a "stop" codon, which terminates translation. The result is a shortened protein that may not function or that may have an abnormal function.

### FRAMESHIFT MUTATION

|          |                         |                            |                         |                       |
|----------|-------------------------|----------------------------|-------------------------|-----------------------|
| Original | CTA<br>LEU<br>(Leucine) | TGG<br>TRP<br>(Tryptophan) | GTA<br>VAL<br>(Valine)  | DNA<br>Amino<br>Acids |
| Mutation | CTA<br>LEU<br>(Leucine) | ATG<br>MET<br>(Methionine) | GGT<br>GLY<br>(Glycine) | DNA<br>Amino<br>Acids |

A frameshift mutation results from the addition or removal of DNA bases that shifts the DNA sequence and the corresponding amino acid sequence. The result is a protein whose sequence, structure, and function are very different from those of the original protein.

### CHROMOSOME REARRANGEMENTS

DNA is wound tightly into structures called chromosomes. Chromosome rearrangements can occur when a piece of a chromosome breaks and is lost entirely (deletion), moves to a different chromosomal location (translocation), flips directions (inversion), or is repeated (duplications). These rearrangements can alter several genes at once. For example, they can generate fusion genes, in which parts of two separate genes are joined together. Proteins made from fusion genes sometimes cause cancer.
