

The background of the book cover is a deep blue astronomical image showing various interstellar clouds. These clouds appear as bright, irregular white and yellowish patches of varying sizes and shapes, some with darker, reddish-brown internal structures. The overall texture is grainy and complex, typical of space imagery.

**Molecular Hydrogen in Space** F. Combes, G. Pineau des Forets, 2000-11-06 Molecular hydrogen is the most abundant molecule in the Universe In recent years advances in theory and laboratory experiments coupled with breakthrough observations with important new telescopes and satellites have revolutionized our understanding of molecular hydrogen in space It is now possible to address the question of how molecular hydrogen formed in the early Universe and the role it played in the formation of primordial structures This timely volume presents articles from a host of experts who reviewed this new understanding at an international conference in Paris This book provides the first multi disciplinary synthesis of our new understanding of molecular hydrogen It covers the theory of the physical processes and laboratory experiments as well as the latest observations It will therefore be an invaluable reference for all students and researchers in astrophysics and cosmology

*The Fullness of Space* Gareth Wynn-Williams, 1992-05-28 This book describes the gas and dust that fills the space between the stars There is a full treatment of the methods that astronomers use to study this interstellar matter The author explains where the matter came from in the first place how it collects together in clouds and clumps and the way in which new stars and planets form from material in space Within our home galaxy the Milky Way the space is never completely empty Although the density is extremely low there is enough matter to make billions of new stars like the Sun We see the matter as glorious gas clouds such as the Orion Nebula shimmering in rich hues of red and orange Telescopes reveal inky black clouds the molecule factories in which new stars and planets are made Radio infrared and ultraviolet telescopes have given astronomers stunning new images of interstellar matter The Fullness of Space is a comprehensive account of what we know about the stuff between the stars It is beautifully illustrated with many of the finest photographs available of dust clouds and bright nebulae The text is non technical No detailed knowledge of astronomy is needed to enjoy this introduction

**The Physical Universe** Frank Shu, 1982 THE PHYSICAL UNIVERSE An Introduction to Astronomy by Frank Shu is a classic text that despite its age still offers up concise and exact explanations of concepts in physics from basic thermodynamics and quantum up to solar and galactic physics and on to cosmology The philosophical ruminations on life not only add to this book's depth but also to its basic sense of humanity

*The Impact of Space Experiments on Our Knowledge of the Physics of the Universe* Franco Giovannelli, Lola Sabau-Graziati, 2013-03-09 Space experiments have opened practically all electromagnetic windows on the Universe A discussion of the most important results obtained with multi frequency photonic astrophysics experiments will provide new input to advance our knowledge of

physics very often in its more extreme conditions A multitude of high quality data across the whole electromagnetic spectrum came at the scientific community's disposal a few years after the beginning of the Space Era With these data we are attempting to explain the physics governing the Universe and its origin which continues to be a matter of the greatest curiosity for humanity In this book we describe the latest steps of the investigations born with the advent of space experiments We highlight the most important results identify unsolved problems and comment on perspectives we can reasonably expect This book aims to provide a useful tool for the reader who is not specialized in space astrophysics and for students Therefore the book is written in the form of a review with a still reasonable length taking into account the complexity of the arguments discussed We do not claim to present a complete picture of the physics governing the Universe but have rather selected particular topics for a more thorough discussion A cross section of essays on historical modern and philosophical topics is offered and combined with personal views into tricks of the space astrophysics trade

In the early years of the twentieth century Victor Hess of Germany flew instruments in balloons and so discovered in 1912 that an extra terrestrial radiation of unknown origin is incident on the earth with an almost constant intensity at all times These penetrating non solar radiations which were called Cosmic Rays by Millikan USA opened the new frontier of space physics and many leading scientists were attracted to it At the end of World War II a number of space vehicles e g stratospheric balloons rockets and satellites were developed In 1950 and onwards these vehicles enabled spectacular advances in space physics and space astrophysics New horizons were opened in the explorations of cosmic rays the earth's magnetosphere the Sun and the heliosphere the moon and the planets Using space borne instruments exciting discoveries were made of stars and galaxies in the infra red ultra violet x ray and gamma ray wavelengths In this text book these fascinating new findings are presented in depth and on a level suitable for senior undergraduate and graduate students research scientists and scientists of other disciplines Although there are several excellent books and monographs on different aspects most of these deal with specific areas In this text book the findings of space physics and astrophysics are presented in an integrated manner with proper introductions to the fundamental aspects and these are supplemented by relevant ground based observations

Tsutomu Watanabe, 1990-02-28 Like a river the progress of science has a tendency to run fast or slow. Once the water meets a dam it may stop for a while but eventually it will flow over the top and run fast again. In scientific research a breakthrough to overcome a similar barrier is often made by a small number of scientists or perhaps by a single person of special creativity, extraordinary talent and unusual perseverance. Through such individuals science can proceed in great strides. No one can deny that Professor Kazuo Takayanagi is one of these special individuals who have played a leading role in the field of atomic and molecular physics as well as space physics. This book is dedicated to Professor Takayanagi on the occasion of his retirement from the Institute of Space and Astronautical Science. Professor Takayanagi was born in 1926 and grew up in Tomakomai in Hokkaido, the northern island of Japan. In his boyhood he was interested in natural sciences, particularly astronomy. On 5th February 1943 when he was attending secondary school a solar eclipse was seen in his town. He organized a group of students from his school to observe the eclipse. He still remembers the scene: it grew so dark during the eclipse that two stars, Vega and Arcturus, could be seen. After graduation from the University of Tokyo in 1948 he entered the graduate school there. *Vision-21, Space Travel for the Next Millennium*, 1991

**Exploring the Universe: From Near Space to Extra-Galactic** Banibrata Mukhopadhyay, Sudipta Sasmal, 2018-10-01 This Festschrift dedicated to the 60th birth anniversary of Prof Sandip K Chakrabarti, a well-known Indian astrophysicist, presents a collection of contributions by about fifty scientists who work on diverse topics in contemporary astrophysics and space science, including new and low-cost balloon-borne experiments, planetary science, astrochemistry, and the origin of life, ionospheric research, and earthquake predictions, relativistic astrophysics around black holes, and finally the observational signatures and radiative properties of compact objects. All the authors are well-known scholars in their respective subject and are all PhD students of Prof Sandip K Chakrabarti. The book demonstrates a two-dimensional evolution of research areas triggered by Sandip Chakrabarti over the past few decades. The first dimension represents the evolution and diversification of Chakrabarti's own research, in which new students were trained. A second dimension arises from the evolution of the research topics pursued by Chakrabarti's fifty odd doctoral students, many of whom have become renowned scientists in their own right after starting with a certain subject under Chakrabarti and then migrating to completely new subjects with dexterity. The editors have compiled and edited the articles appropriately to some extent to suit the spirit of this Festschrift on the one hand and to keep balance in diverse topics on the other. Thus this volume also provides an overview for whosoever wishes to enter the important subjects of compact objects, astrochemistry, ionospheric science, or space exploration in near space. New graduates, PhD scholars, teachers, and researchers will benefit from this volume. Moreover, it is a record of tremendous success of a school in a range of vast topics.
