Abstract The purpose of this study was to determine whether there were differences in the prevalence of self-reported depression between men and women who had been exposed to violence by intimate partners. Data from the National Longitudinal Study of Women's Health are used. Results show that among those who have ever been married, 6% of men and 9% of women reported having experienced depression during their lifetime. Among those who had been married at least once and were currently married, 7% of men and 10% of women reported having experienced depression during their lifetime. Among those who had been married at least once and were currently separated or divorced, 8% of men and 12% of women reported having experienced depression during their lifetime. Among those who had never been married, 4% of men and 5% of women reported having experienced depression during their lifetime. These results suggest that exposure to violence by intimate partners may be associated with higher rates of self-reported depression.

Molecular Machinery Of The Membrane

Molecular Machinery Of The Membrane:

Molecular Machinery of the Membrane Gerald M. Edelman, 1975 *Membranes to Molecular Machines* Mathias Grote, 2019-07-09 Today's science tells us that our bodies are filled with molecular machinery that orchestrates all sorts of life processes. When we think microscopic channels open and close in our brain cell membranes when we run, tiny motors spin in our muscle cell membranes and when we see light operates molecular switches in our eyes and nerves. A molecular mechanical vision of life has become commonplace in both the halls of philosophy and the offices of drug companies where researchers are developing proton pump inhibitors or medicines similar to Prozac. *Membranes to Molecular Machines* explores just how late twentieth century science came to think of our cells and bodies this way. This story is told through the lens of membrane research, an unwritten history at the crossroads of molecular biology, biochemistry, physiology and the neurosciences that directly feeds into today's synthetic biology as well as nano and biotechnology. Mathias Grote shows how these sciences not only have made us think differently about life, they have by reworking what membranes and proteins represent in laboratories allowed us to manipulate life as active matter in new ways. Covering the science of biological membranes in the United States and Europe from the mid 1960s to the 1990s, this book connects that history to contemporary work with optogenetics, a method for stimulating individual neurons using light, and will enlighten and provoke anyone interested in the intersection of chemical research and the life sciences from practitioner to historian to philosopher. The research described in the book and its central actor Dieter Oesterhelt were honored with the 2021 Albert Lasker Basic Medical Research Award for his contribution to the development of optogenetics.
