## **Molecular Mechanisms In Striated Muscle:**

**Molecular Mechanisms in Striated Muscle** S. V. Perry, 1996-09-13 Striated muscle is the most common muscle type in the vertebrate body This book describes in molecular terms the components and intracellular events responsible for the contraction and relaxation of striated muscle The topic is introduced with a discussion of motile systems occurring throughout the biological world and their relation to the highly specialised contractile system of muscle Professor Perry then goes on to discuss the mechanochemical process and the regulatory roles of calcium I filament proteins and phosphorylation The book ends with an examination of the role of dystrophin and its implications in Duchenne muscular dystrophy the most common form of muscle disease *Molecular Mechanisms in Striated Muscle* will provide an important source of information and current theory for researchers and postgraduate students in muscle physiology biochemistry and medicine

*Molecular Control Mechanisms in Striated Muscle Contraction* R.J. Solaro, R. Moss, 2013-04-17 *Molecular Control Mechanisms in Striated Muscle Contraction* addresses the molecular mechanisms by which contraction of heart and skeletal muscles is regulated as well as the modulation of these mechanisms by important patho physiological variables such as ionic composition of the myoplasm and phosphorylations of contractile and regulatory proteins For the novice this volume includes chapters that summarize current understanding of excitation contraction coupling in striated muscles as well as the compositions and structures myofibrillar thick and thin filaments For the expert this volume presents detailed pictures of current understanding of the mechanisms underlying the CA2 regulation of contraction in heart and skeletal muscles and discusses important directions for future investigation

**Sex Steroids and Apoptosis In Skeletal Muscle: Molecular Mechanisms** Andrea A. Vasconsuelo, 2019-06-03 This monograph focuses on the actions exerted by sex hormones 17 estradiol and testosterone in skeletal muscle tissue An important consideration of this volume is the fact that both estrogen receptors ERs and androgen receptors ARs are ubiquitously expressed and as a result steroid hormones affect growth and different cell functions in several organs Moreover ERs and ARs may have a non classical pattern of intracellular localizations raising complexity to the functional roles of estradiol and testosterone Readers will find key information about the role of sex hormones in mitochondrial physiology and their relation with ageing apoptosis and sarcopenia Chapters integrate important points with the latest information on the subject including work of leading researchers studying the cellular and molecular mechanisms underlying the age linked changes in muscle tissue while highlighting the role of satellite cells Furthermore the book presents a chapter about phytoestrogens compounds which are structurally very similar to estrogen 17 estradiol and their selective action on sex steroid receptors specifically they have a higher affinity for ER receptors than ER receptors The book is recommended reading for scientists and clinicians involved in the field of medical and health sciences as well as for scholarly readers students of biochemistry and medicine who are interested in the molecular mechanism of cellular apoptosis regulated by steroid hormones

*Molecular Mechanisms of Muscular Dystrophies* Steve J. Winder, 2006-01-26 There is no

doubt that the study of the muscular dystrophies in recent years has been exciting and rewarding. It has attracted the attention of many investigators of international repute and this is reflected in the various contributions to this volume.

**Molecular Mechanisms of Muscular Dystrophies** represents a personal collection of chapters covering *Molecular Mechanisms of Cardiac Hypertrophy and Failure* Richard A. Walsh, 2005-11-29. This title reviews current knowledge of the mechanisms contributing to heart failure. Editor Richard Walsh and an internationally renowned team of contributors discuss key advances in molecular and cell biology, biochemistry, and pharmacology, focusing on advances that have a direct bearing on current clinical studies. It highlights developments across a broad range of disciplines with in-depth coverage of each topic, providing background and perspective on current literature. By setting new advances in a broader context, this text allows readers to compare different ideas and evaluate their importance in their own areas of research or clinical practice.

The Molecular Mechanisms of Length-dependent Activation in Striated Muscle John P. Konhilas, 2001 Research Awards Index, 1989 *Molecular Mechanisms of Cellular Growth* Howard E. Morgan, 2012-12-06 **Subject Index of Current Research Grants and Contracts Administered by the National Heart, Lung and Blood Institute** National Heart, Lung, and Blood Institute, 1979 **Biomedical Index to PHS-supported Research**, Skeletal Muscle Structure, Function, and Plasticity Richard L. Lieber, 2002. In its Second Edition, this text addresses basic and applied physiological properties of skeletal muscle in the context of the physiological effects from clinical treatment. Many concepts are expanded, and recent studies on human muscle have been added. This new edition also includes more clinically relevant cases and stories. A two-page full-color insert of muscle sections is provided to ensure integral understanding of the concepts presented in the text. Anyone interested in human movement analysis and the understanding of generation and control from the musculoskeletal and neuromuscular systems in implementing movement will find this a valuable resource.

**Molecular Mechanisms in Nutritional Epigenetics** Luis M. Vaschetto, 2024-05-23. This volume in the Epigenetics and Human Health series explores the intersection of diet and epigenetic modifications. It provides the reader with the latest research on how diet can influence our genetic and epigenetic profiles, thereby affecting our health and susceptibility to disease. In recent years, the field of nutritional epigenetics (nutri-epigenetics) has expanded significantly, shedding light on how environmentally driven epigenetic pathways can be modulated through nutrition and eating habits. The book provides a comprehensive introduction to the various epigenetic mechanisms affected by dietary compounds and focuses on specific topics such as the relationship between diet and the gut microbiome, the impact of diet on cardiovascular disease and psychopathology, and the role of diet in pregnancy. Written by an international team of experts, this book reveals the molecular mechanisms underlying the influence of diet on epigenetic modifications and discusses the prospect of personalized medicine using dietary strategies to promote well-being and protect against diseases. The book is aimed at researchers and students in the fields of human nutrition, genetics, and medicine.

**Molecular Mechanism of Muscle Contraction** Haruo Sugi, Gerald H. Pollack, 1988. It

is now widely recognized that fundamental progress in science is made not in a continuous manner but in a stepwise manner. In the field of the molecular mechanism of contraction in striated muscle the stepwise progress was achieved by three great investigators in the 1940s and 1950s. In the early 1940s Albert Szent-Györgyi and his associates showed biochemically that muscle contraction is essentially an interaction between actin and myosin coupled with ATP hydrolysis. Then in the 1950s Hugh E. Huxley together with Jean Hanson demonstrated that striated muscle is composed of a hexagonal lattice of two kinds of interdigitating myofilaments consisting of actin and myosin respectively and made a monumental discovery that muscle contraction results from the relative sliding between the actin and myosin filaments. Andrew F. Huxley, who also participated in the discovery of the sliding filament mechanism of muscle contraction, was attributed to the attachment-detachment cycle between the cross bridges extending from the myosin filament and the complementary sites on the actin filament. After the above stepwise progress, however, muscle research appears to have entered into a period of so-called normal science where detailed knowledge has been accumulating around the well-established central dogmas but without fundamental progress. More specifically, most experiments on muscle contraction mechanisms have been designed, carried out, and interpreted on the basis of the Huxley's 1957 and the Huxley-Simmons 1971 contraction models as well as the kinetic scheme of actomyosin ATPase, but the molecular mechanism of contraction still remains to be a matter for debate and speculation. For further fundamental progress in this field of research, we feel it necessary to reconsider the validity of these dogmas and to interpret the results more freely. In 1978 one of us (H.S.) organized a symposium in Tokyo based on the above idea, and we published the proceedings under the title of *Cross-bridge Mechanism in Muscle Contraction*, ed. H. Sugi and G. H. Pollack, University of Tokyo Press. University Park Press, 1979. The unusual interest of muscle physiologists in this symposium encouraged us to organize a second symposium on muscle contraction in Seattle in 1982, and the proceedings were again published under the title of *Contractile Mechanisms in Muscle*, ed. G. H. Pollack and H. Sugi, Plenum Publishing Corporation, 1984. We were again very much encouraged by the intense interest of the people at the symposium as well as by readers of the proceedings and became convinced that the symposia of this kind would greatly accelerate the progress in this field. The present symposium was organized by one of us (H.S.) as the third Cross-bridge symposium. Though most papers are concerned as in the previous two symposia with experiments on intact and demembrated muscle fibers and isolated myofibrils where the three-dimensional myofilament lattice structures have been preserved, the results are frequently discussed in connection with the kinetics of actomyosin ATPase, reflecting the recent development of experimental methods connecting physiology and biochemistry. It has also become possible to obtain direct information about the orientation and configuration of the cross bridges at various stages during muscle contraction.
