Roshchina, 2012-12-06 The secretory activity of plants is a manifestation of the fundamental property of all living organisms the ability to exchange substances and energy with the environment This book summarizes today's knowledge of all such secretory activities of higher plants It equally considers the cellular aspects intratissular and external secretion gas excretion and the excretion of substances under extreme conditions as well as the biological effects of plant excreta *DNA-based markers in plants* R.L. Phillips, Indra K. Vasil, 2012-12-06 The double helix architecture of DNA was elucidated in 1953 Twenty years later in 1973 the discovery of restriction enzymes helped to create recombinant DNA

molecules in vitro The implications of these powerful and novel methods of molecular biology and their potential in the genetic manipulation and improvement of microbes plants and animals became increasingly evident and led to the birth of modern biotechnology The first transgenic plants in which a bacterial gene had been stably integrated were produced in 1983 and by 1993 transgenic plants had been produced in all major crop species including the cereals and the legumes These remarkable achievements have resulted in the production of crops that are resistant to potent but environmentally safe herbicides or to viral pathogens and insect pests In other instances genes have been introduced that delay fruit ripening or increase starch content or cause male sterility Most of these manipulations are based on the introduction of a single gene generally of bacterial origin that regulates an important monogenic trait into the crop of choice Many of the engineered crops are now under field trials and are expected to be commercially produced within the next few years The early successes in plant biotechnology led to the realization that further molecular improvement of plants will require a thorough understanding of the molecular basis of plant development and the identification and characterization of genes that regulate agronomically important multi genic traits
