ion beam therapy offers the possibility of excellent dose localization for treatment of malignant tumours minimizing radiation damage in normal tissue whilst maximizing cell killing within the tumour offering a significant development in cancer therapy. The full potential of such therapy can only be realized by better understanding the physical chemical and biological mechanisms on a range of time and space scales that lead to cell death under ion irradiation. This book describes how using a multiscale approach experimental and theoretical expertise available can lead to greater insight at the nanoscopic and molecular level into radiation damage of biological targets induced by ion impact. The book is intended for advanced students and specialists in the areas of physics chemistry biology and medicine related to ion beam therapy radiation protection biophysics radiation nanophysics and chemistry atomic and molecular physics condensed matter physics and the physics of interaction of charged particles with matter. One of the most important features of the book is the inclusive multiscale approach to the understanding of complex and highly interdisciplinary processes behind ion beam cancer therapy which stretches from the atomistic level up to the biological scale and is demonstrated to be in excellent agreement with experimental observations.
