Meier,2006-05-29 Since the publication of the third edition of Geriatric Medicine extraordinary advances have occurred in the science of aging and the potential for biomedical research to give us answers to many if not most of the age related disorders that threaten the quality of life in older years At the most basic level the successful mapping of the

human genome was declared complete in the fall of 2000 Understanding the map of the human genome is as important as understanding the map of genomes of important laboratory species ranging from the microscopic worms and fruit flies used in most classic genetic studies to rodents such as laboratory mice and eventually to primates on which much of the research on the aging human brain is done The genetic maps of all of these species including our own does not answer clinical questions but it does open the door to dramatic rapid and efficient answers to questions about the genetic polymorphisms related to diseases in humans The telomerase story also unfolded since the third edition Telomerase is an enzyme responsible for maintaining the telomeres the redundant DNA portions at the end of chromosomes whose shortening seems to be linked directly to cell senescence apoptosis and the control over cell death which at the level of the individual cell seems to be linked to the decline of organ function and eventually aging and death within the organism

and task engagement Only recently have theorists and empiricists begun to recognize that dispositional and state motivations impact the ways individuals approach interpersonal interactions In addition researchers are now recognizing that the quality of interpersonal interactions influences consequent happiness and task engagement thus helping to explain previous findings to this end Similarly social psychology and relationships researchers have focused on the impact of cognitions emotions and behaviors on people s relationships In their work relationships researchers demonstrate that both contextual characteristics and individual differences influence the quality of interactions Many of these studies seek to understand which characteristics strengthen the bonds between people encourage empathy and trust and create a sense of well being after a close interaction This work seeks to integrate the field of human motivation and interpersonal relationships Both fields have seen extensive growth in the past decade and each can contribute to the other However no single compiled work is available that targets both fields This is the case in part because only now is there enough work to make a strong and compelling case for their integration In the previous years research has been conducted to show that motivation is relevant and important for interactions among strangers and in close relationships In addition developmental mechanisms for these relations are identified and mechanisms by which motivation strengthens people s relationships Finally recent work has demonstrated the many implications for interpersonal relationships showing that motivation impacts a range of interpersonal processes from prejudice regulation and objectification of others to empathy and care This book seeks to summarize and organize all these findings and present them in a way that is relevant to both motivation researchers and social and relationship researchers
