

Upper Respiratory Components and Functions

*Nasal Cavity

- > Nose – air enters and leaves, hairs block entry of dust
- > Nasal mucous – ciliated epithelium, with goblet cells that produce mucus
- > Conchae – increases surface area of the nasal mucosa
- > Olfactory receptors – detect vaporized chemicals that have been inhaled, the olfactory nerves pass through the ethmoid bone to brain
- > Paranasal sinuses – air cavities in the maxillae, frontal, sphenoid and ethmoid bones. Bones are lined with cilia epithelium, mucus produced drains into cavity. Provide resonance for the voice (more air).
- ◊ Nasal cavities warm air and humidity to 100% prior to reaching lungs

*Pharynx

- > Nasopharynx – behind nasal cavities
- > Soft palate – elevated during swallowing to block nasopharynx and prevent food or saliva from going up rather than down
- > Eustachian tubes – permit air to enter or leave middle ears, allowing ear drums to vibrate properly
- > Oropharynx – behind mouth, its mucosa is stratified squamous epithelium.
- ◊ Lymph nodes, adenoid and lingual tonsils form ring of lymphatic tissue around pharynx to destroy pathogens.

*Larynx

- > Passageway for air between the pharynx and the trachea
- > Mucosa layer is called ciliated epithelium (except the vocal cords) they sweep upward to remove mucus, trapped dust and microorganisms
- > Made of nine pieces of cartilage connected by ligaments to keep airway open at all times
 - ◊ Thyroid cartilage – largest cartilage
 - ◊ Epiglottis – uppermost cartilage, acts as trap door when swallowing to prevent entry of saliva or food into larynx
- > Vocal cords – on either side of glottis. During breathing the VC are held at the sides of glottis so that air passes freely in and out of trachea

Respiratory Physiology John B West, 2013-05-27
Present day respiratory physiology stems largely from the explosion of ideas which took place during and after World War II A number of the major players are still active but the opportunity to prepare a personal history of this branch of medicine will soon be lost In a sense then this book offers an exceptional even unique opportunity We are offered a first hand chronicle of the advancements made in respiratory physiology in the course of this century by one of the principal figures in the field The volume covers every aspect of the evolution of this important area of knowledge morphology gas exchange and blood flow mechanics control of ventilation and comparative physiology Some of the chapters are personal accounts of the development of respiratory physiology as observed by the author It is hoped that what is lost in objectivity by this approach is more than made up by the captivating insights provided by the author into the process of scientific research and discovery
