Response Of Nuclei Under Extreme Conditions:

The Response of Nuclei under Extreme Conditions R.A. Broglia, G.F. Bertsch, 2012-12-06 In recent years a new field of nuclear research has been opened through the possibility of studying nuclei with very large values of angular momentum temperature pressure and number of particles This development has been closely associated with heavy ion reactions since collisions between two heavy nuclei are especially effective in producing metastable compound systems with large angular momentum and in transferring energy which is distributed over the whole nuclear volume Under the strain of temperature and of the Coriolis and centrifugal forces the nucleus displays structural changes which can be interpreted in terms of pairing and shape phase transitions This was the subject of the lectures of J D Garrett P J Twin and S Levit While the rotational motion is at zero temperature undamped the width of giant resonances indicate that the nucleus only oscillates through few periods before the motion is damped by particle decay and through coupling to the compound nucleus Temperature and angular momentum influence in an important way the properties of both giant resonances and rotational motion These subjects were developed by K Snover and by P F Bortignon and R A Broglia as well as by A Bracco A Dellafiore and F Matera
