Predictably Dependable Computing Systems Brian Randell, Jean-Claude Laprie, Hermann Kopetz, Bev Littlewood, 2013-11-11 *Dependable Computing for Critical Applications 3* Carl E. Landwehr, Brian Randell, Luca Simoncini, 2013-06-29 This volume contains the papers presented at the Third IFIP International Working Conference on Dependable Computing for Critical Applications sponsored by IFIP Working Group 10.4 and held in Mondello Sicily Italy on September 14-16 1992. System developers increasingly apply computers where they can affect the safety and security of people and equipment. The Third IFIP International Working Conference on Dependable Computing for Critical Applications like its predecessors addressed various aspects of computer system dependability a broad term defined as the degree of trust that may justifiably be placed in a system's reliability availability safety security and performance. Because the scope of the conference was so broad we hope the presentations and discussions will contribute to the integration of these concepts so that future computer based systems will indeed be more dependable. The Program Committee selected 18 papers for presentation from a total of 74 submissions at a May meeting in Newcastle upon Tyne UK. The resulting program represented a broad spectrum of interests with papers from universities corporations and government agencies in eight countries. Much diligent work by the Program Committee and the quality of reviews from more than a hundred external referees from around the world for which we are most grateful significantly eased the production of this technical program.

Responsive Computer Systems Hermann Kopetz, Yoshiaki Kakuda, 2012-12-06 For the second time the International Workshop on Responsive Computer Systems has brought together a group of international experts from the fields of real time computing distributed computing and fault tolerant systems. The two day workshop met at the splendid facilities at the KDD Research and Development Laboratories at Kamifukuoka Saitama in Japan on October 1 and 2 1992. The program included a keynote address a panel discussion and in addition to the opening and closing session six sessions of submitted presentations. The keynote address 'The Concepts and Technologies of Dependable and Real time Computer Systems for Shinkansen Train Control' covered the architecture of the computer control system behind a very responsive i.e. timely and reliable transport system the Shinkansen Train. It has been fascinating to listen to the operational experience with a large fault tolerant computer application. What are the Key Paradigms in the Integration of Timeliness and Reliability was the topic of the lively panel discussion. Once again the pros and cons of the time triggered versus the event triggered paradigm in the design of real time systems were discussed. The eighteen submitted presentations covered diverse topics about important issues in the design of responsive systems and a session on progress reports about leading edge research projects. Lively discussions characterized both days of the meeting. This volume contains the revised presentations that incorporate some of the discussions that occurred during the meeting. *Fundamentals of Computation Theory* Horst Reichel, 1995-08-16 This book presents the proceedings of the 10th International Conference on Fundamentals of Computation Theory FCT 95 held in

Dresden Germany in August 1995 The volume contains five invited lectures and 32 revised papers carefully selected for presentation at FCT 95 A broad spectrum of theoretical computer science is covered among topics addressed are algorithms and data structures automata and formal languages categories and types computability and complexity computational logics computational geometry systems specification learning theory parallelism and concurrency rewriting and high level replacement systems and semantics

Foundations of Dependable Computing Gary M. Koob, Clifford G. Lau, 2007-11-23

Foundations of Dependable Computing: Paradigms for Dependable Applications presents a variety of specific approaches to achieving dependability at the application level. Driven by the higher level fault models of *Models and Frameworks for Dependable Systems* and built on the lower level abstractions implemented in a third companion book subtitled *System Implementation*, these approaches demonstrate how dependability may be tuned to the requirements of an application, the fault environment, and the characteristics of the target platform. Three classes of paradigms are considered: protocol based paradigms for distributed applications, algorithm based paradigms for parallel applications, and approaches to exploiting application semantics in embedded real time control systems. The companion volume subtitled *Models and Frameworks for Dependable Systems* presents two comprehensive frameworks for reasoning about system dependability, thereby establishing a context for understanding the roles played by specific approaches presented in this book's two companion volumes. It then explores the range of models and analysis methods necessary to design, validate, and analyze dependable systems. Another companion book published by Kluwer, subtitled *System Implementation*, explores the system infrastructure needed to support the various paradigms of *Paradigms for Dependable Applications*. Approaches to implementing support mechanisms and to incorporating additional appropriate levels of fault detection and fault tolerance at the processor, network, and operating system level are presented. A primary concern at these levels is balancing cost and performance against coverage and overall dependability. As these chapters demonstrate, low overhead practical solutions are attainable and not necessarily incompatible with performance considerations. The section on innovative compiler support in particular demonstrates how the benefits of application specificity may be obtained while reducing hardware cost and run time overhead.

Dependable Computing for Critical Applications 4 Flaviu Cristian, Gerard LeLann, Teresa Lunt, 1995-03-31

This volume contains the articles presented at the Fourth International FIP Working Conference on Dependable Computing for Critical Applications held in San Diego, California, on January 4-6, 1994. In keeping with the previous three conferences held in August 1989 at Santa Barbara, USA; in February 1991 at Tucson, USA; and in September 1992 at Mondello, Italy, the conference was concerned with an important basic question: can we rely on computer systems for critical applications? This conference, like its predecessors, addressed various aspects of dependability: a broad term defined as the degree of trust that may justifiably be placed in a system's reliability, availability, safety, security, and performance. Because of its broad scope, a main goal was to contribute to a unified understanding and integration of these concepts. The Program Committee selected 21 papers for presentation from a total of 95 submissions at a September meeting in Menlo Park, California. The resulting program

represents a broad spectrum of interests with papers from universities corporations and government agencies in eight countries The selection process was greatly facilitated by the diligent work of the program committee members for which we are most grateful As a Working Conference the program was designed to promote the exchange of ideas by extensive discussions All paper sessions ended with a 30 minute discussion period on the topics covered by the session In addition three panel sessions have been organized
