Multifunctional Nanomaterials: Role and Perspectives in Combination Therapies Against Cancer Wang Zheng, Junjie Li, Jinbing Xie, 2022-06-30

Smart Stimuli-responsive Biomaterials for Programmed Drug Delivery, 2nd edition Seyed Morteza Naghib, Ali Maleki, Yasser Zare, Kyong Rhee, 2024-08-29. Most drugs are toxic to cells that often kill healthy cells and establish several side effects. Conventional chemotherapy cargoes are not tumor specific and commonly their nature leads to significant toxic effects on healthy tissues. Therefore, several drug delivery systems (DDSs) were developed to amend the therapeutic properties of drugs and made them safer and more effective. Local drug delivery which decreases systemic drug exposure is an important approach for maximal efficacy, high levels of patient compliance, and fewer side effects. Smart drug delivery systems (SDDSs) have gained much attention and paved the way for more effective treatment of patients. SDDSs with stimuli-responsive characteristics are determined as the process that the payloads are not released before reaching the target site. This triggered release occurs due to the variations in the nano microcarrier chemistry and structure in response to endogenous and/or exogenous stimulus, establishing the release of the cargoes to the exact place. Responsive and smart materials/biomaterials are responsive/sensitive to signals originating from physiological systems or to abnormalities originating from pathological defects that can interact with or be triggered by the biological environments and are interesting in drug delivery platforms/devices for developing next-generation accurate medicines. In exogenously triggered drug/gene release, it is controlled by external stimulus which can be controlled exactly. Different exogenous triggers have been reported such as light, magnetic field, temperature, electrical field, and ultrasound. The endogenous triggers such as pH, redox, enzyme concentration, and bio molecules are related to the disease's pathological characteristics. Disease pathological characteristics are key parameters as physiological triggers for designing programmed delivery devices that may be used for the non-invasive and effective treatment of a wide range of pathological conditions such as cancer, infections, diabetes, cardiovascular diseases, autoimmune disorders, stroke, and chronic wounds and degenerative diseases. Endogenously triggered drug release is the same as exogenously triggered drug release which can lead to enhanced release of therapeutic molecules at the target place in its therapeutic concentration, reducing local toxicity and side effects, reducing the need for repeat administrations, and increasing patient compliance. Here we focused on smart endogenous and exogenous stimuli-responsive biomaterials for programmed drug delivery. The conventional drug delivery systems are not without any limitations and challenges. One of the most important challenges is related to their degradability or insufficient biocompatibility of most materials which are used in smart delivery system. Another challenge is related to the using of 2D in vitro models or in vivo animal studies to evaluate the performance of these systems and there is a poor relation between such

results and human clinical trials Thus these incompatibilities can lead to the failing of the numerous smart systems in clinical studies In this special issue we focus on smart multi responsive drug delivery systems that can address some challenges and drawbacks Research paper commutation letter mini review and review are acceptable for publications in this special issue Main topics 1 Smart exogenous triggered delivery systems 2 Smart endogenous triggered delivery systems 3 Multi responsive targeted vehicles 4 Stimuli responsive niosomes and liposomes 5 Multifunctional biomaterials for cancer treatment 6 Smart 3D and 4D scaffolds for localized delivery systems

Textbook of Bone Metastases Claude Jasmin,Rodolfo Capanna,Lawrence Coia,Robert Coleman,Gerard Saillant,2005-09-27 The epidemiological and clinical importance of bone metastases has long been recognised For example the incidence of bone metastases in breast and prostate cancers is 70% whereas it is only 30 to 40% in metastatic lung cancer In clinical terms bone metastases have substantial negative effects on the patient s quality of life Bone metastases have generally received insufficient attention because of the difficulty in quantifying them which has left them outside the scope of therapeutic trials This textbook is the result of the remarkable progress made in the understanding of the molecular and cellular mechanisms involved in osteogenesis and osteolysis and their development for therapeutic purposes The treatment of malignant hypercalcaemia has also been revolutionised by the use of bisphosphonates The Textbook of Bone Metastases presents a broad approach to recent progress in all fields related to bone metastases ranging from epidemiology to the physiopathology of bone metastases and therapeutics It provides a better understanding of recent advances and more importantly will give clinicians all the information needed to help them in the clinical and therapeutic management of patients with bone metastases
