Subsymbolic Natural Language Processing Risto Miikkulainen, 1993 Risto Miikkulainen draws on recent connectionist work in language comprehension to create a model that can understand natural language Using the DISCERN system as an example he describes a general approach to building high level cognitive models from distributed neural networks and shows how the special properties of such networks are useful in modeling human performance In this approach connectionist networks are not only plausible models of isolated cognitive phenomena but also sufficient constituents for complete artificial intelligence systems Distributed neural networks have been very successful in modeling isolated cognitive phenomena but complex high level behavior has been tractable only with symbolic artificial intelligence techniques Aiming to bridge this gap Miikkulainen describes DISCERN a complete natural language processing system implemented entirely at the subsymbolic

level In DISCERN distributed neural network models of parsing generating reasoning lexical processing and episodic memory are integrated into a single system that learns to read paraphrase and answer questions about stereotypical narratives Miikkulainen's work which includes a comprehensive survey of the connectionist literature related to natural language processing will prove especially valuable to researchers interested in practical techniques for high level representation inferencing memory modeling and modular connectionist architectures Risto Miikkulainen is an Assistant Professor in the Department of Computer Sciences at The University of Texas at Austin

High-level Motion Processing Takeo Watanabe, 1998 The contributors to this book focus on such key aspects of motion processing as interaction and integration between locally measured motion units structure from motion heading in an optical flow and second order motion They also discuss the interaction of motion processing with other high level visual functions such as surface representation and attention

Visual Navigation Yiannis Aloimonos, 2013-05-13 All biological systems with vision move about their environments and successfully perform many tasks The same capabilities are needed in the world of robots To that end recent results in empirical fields that study insects and primates as well as in theoretical and applied disciplines that design robots have uncovered a number of the principles of navigation To offer a unifying approach to the situation this book brings together ideas from zoology psychology neurobiology mathematics geometry computer science and engineering It contains theoretical developments that will be essential in future research on the topic especially new representations of space with less complexity than Euclidean representations possess These representations allow biological and artificial systems to compute from images in order to successfully deal with their environments In this book the barriers between different disciplines have been smoothed and the workings of vision systems of biological organisms are made clear in computational terms to computer scientists and engineers At the same time fundamental principles arising from computational considerations are made clear both to empirical scientists and engineers Empiricists can generate a number of hypotheses that they could then study through various experiments Engineers can gain insight for designing robotic systems that perceive aspects of their environment For the first time readers will find the insect vision system presented in a way that can be understood by computational scientists working in computer vision and engineering three complete working robotic navigation systems presented with all the issues related to their design analyzed in detail the beginning of a computational theory of direct perception as advocated by Gibson presented in detail with applications for a variety of problems and the idea that vision systems could compute space representations different from perfect metric descriptions and be used in robotic tasks advanced for both artificial and biological systems

Visual Communication Ajay Kumar, 2008 A valuable resource book for plant operations and human relations managers this text discusses how successful companies develop meeting and communication areas communicate work standard production controls and make goals and progress visible This book explains why conventional work areas where fragmented information flows from top to bottom

must be replaced by the visual workplace where information flows in every direction It details how visual management can make the factory a place where workers and supervisors freely communicate so that every employee could take improvement action **Invertebrate Vision** Eric Warrant,Dan-Eric Nilsson,2006-10-05 Publisher description *The Human Semantic*

Potential Terry Regier,1996 Drawing on ideas from cognitive linguistics connectionism and perception *The Human Semantic Potential* describes a connectionist model that learns perceptually grounded semantics for natural language in spatial terms Languages differ in the ways in which they structure space and Regier s aim is to have the model perform its learning task for terms from any natural language The system has so far succeeded in learning spatial terms from English German Russian Japanese and Mixtec The model views simple movies of two dimensional objects moving relative to one another and learns to classify them linguistically in accordance with the spatial system of some natural language The overall goal is to determine which sorts of spatial configurations and events are learnable as the semantics for spatial terms and which are not Ultimately the model and its theoretical underpinnings are a step in the direction of articulating biologically based constraints on the nature of human semantic systems Along the way Regier takes up such substantial issues as the attraction and the liabilities of PDP and structured connectionist modeling the problem of learning without direct negative evidence and the area of linguistic universals which is addressed in the model itself Trained on spatial terms from different languages the model permits observations about the possible bases of linguistic universals and interlanguage variation **Biomedical Index to**

PHS-supported Research: pt. A. Subject access A-H ,1994 *Dynamics of Visual Motion Processing* Guillaume S. Masson,Uwe J. Ilg,2009-12-02 Motion processing is an essential piece of the complex brain machinery that allows us to reconstruct the 3D layout of objects in the environment to break camouflage to perform scene segmentation to estimate the ego movement and to control our action Although motion perception and its neural basis have been a topic of intensive research and modeling the last two decades recent experimental evidences have stressed the dynamical aspects of motion integration and segmentation This book presents the most recent approaches that have changed our view of biological motion processing These new experimental evidences call for new models emphasizing the collective dynamics of large population of neurons rather than the properties of separate individual filters Chapters will stress how the dynamics of motion processing can be used as a general approach to understand the brain dynamics itself *From Neuron to Action* Lüder Deecke,John Eccles,Vernon B. Mountcastle,2013-03-09 A rich source of information about human voluntary movement in health and disease can be found in this book The most esteemed researchers in their respective fields bring you up to date articles Their collected work combines fundamental research in the life sciences with clinical neuroscience in a unique overview The interdisciplinary aspects of motor physiology uncover a wealth of information for researchers from neighboring disciplines For example oculomotor research vestibular research equilibrium sensory research and cognition evolution synaptic and elementary processes and the neurological sciences can be discovered *Current Catalog* National Library of

Snowden,1994 The brain s ability to detect movement within the retinal image is crucial not only for determining the trajectories of moving objects but also for identifying and interpreting image motion resulting from eye and head movements This book summarizes our knowledge of how information about image motion is encoded in the brain Key Features Valuable reference source for those involved in the rapidly expanding area of motion perception Strong emphasis on integration of physiological computation and psychophysical approaches Topics include Principles of local motion detection Inputs to local motion detectors Integration of motion signals Higher order interpretation of motion Motion detection and eye movements Rethinking Innateness Jeffrey L. Elman,1996 Rethinking Innateness asks the question What does it really mean to say that a behavior is innate The authors describe a new framework in which interactions occurring at all levels give rise to emergent forms and behaviors These outcomes often may be highly constrained and universal yet are not themselves directly contained in the genes in any domain specific way One of the key contributions of Rethinking Innateness is a taxonomy of ways in which a behavior can be innate These include constraints at the level of representation architecture and timing typically behaviors arise through the interaction of constraints at several of these levels The ideas are explored through dynamic models inspired by a new kind of developmental connectionism a marriage of connectionist models and developmental neurobiology forming a new theoretical framework for the study of behavioral development While relying heavily on the conceptual and computational tools provided by connectionism Rethinking Innateness also identifies ways in which these tools need to be enriched by closer attention to biology **Human Motion** Bodo Rosenhahn,Reinhard Klette,Dimitris Metaxas,2008 This is the first book which informs about recent progress in biomechanics computer vision and computer graphics all in one volume Researchers from these areas have contributed to this book to promote the establishment of human motion research as a multi faceted discipline and to improve the exchange of ideas and concepts between these three areas The book combines carefully written reviews with detailed reports on recent progress in research
