The population of bacteria in a lab experiment starts at 6,000 and grows by 14% per day.

How many new bacteria are created in 1 day?

$$14\% = \frac{14}{100} = 0.14$$

$$\frac{14}{100} \cdot 6,000 = \frac{84,000}{100} = 840$$

$$(0.14)(6,000) = 840$$

How many bacteria will there be 1 day into the experiment?

$$6,000 + 840 = 6,840$$

American Science Policy since World War II Bruce Smith,2011-02-01 Just after the close of World War II America s political and scientific leaders reached an informal consensus on how science could best serve the nation and how government might best support science The consensus lasted a generation before it broke under the pressures created by the Vietnam War Since then the nation has struggled to reestablish shared beliefs about the means and goals of science policy In *American Science Policy Since World War II* author Bruce L R Smith makes sense of the break between science and government and identifies the patterns on postwar science affairs He explains that what might otherwise seem to be a miscellaneous set of separate episodes actually constituted a continuing debate of national importance that was closely linked to broad political and economic trends Smith s precise and unique analysis gives both the scholar and historian a better understanding of where we are and how we got there while casting a modest light on future policy directions
