The Atmosphere and Ionosphere Vladimir Bychkov, Gennady Golubkov, Anatoly Nikitin, 2010-07-17 From July 7 to 12 2008 in Zelenogradsk a cosy resort on the bank of the Baltic Sea near Kaliningrad in Russia the 1st International Conference Atmosphere Ionosphere Safety AIS 2008 has been carried out The State Russian University of I Kant Semenov Institute of chemical physics of the Russian Academy of Sciences Pushkov Institute of terrestrial magnetism and radio waves propagation of the Russian Academy of Sciences and Russian Committee on Ball Lightning BL have acted as organizers of the conference Financial support was made by Russian Fund of Fundamental Research Project N 08 03 06041 and European Office of Aerospace Research and Development Grant award FA8655 08 1 5052 The International conference Atmosphere Ionosphere Safety AIS 2008 was devoted to i the analysis of the atmosphere ionosphere response on natural and man made processes the reasons of occurrence of the various accompanying geophysical phenomena and an estimation of possible consequences of their influence on the person and technological systems ii the study of the monitoring possibility and search of the ways for the risk level decrease Discussion of the physical and chemical processes accompanying the observable

geophysical phenomena was undertaken. One can see from a list of the Conference sections that questions of safety took only a rather modest place so main topics of the Conference became discussion of processes taking place in the atmosphere ionosphere and methods of monitoring these processes.

Physics of Highly Excited Atoms and Ions Vladimir S. Lebedev, Israel L. Beigman, 2012-12-06 This monograph is devoted to the basic aspects of the physics of highly excited Rydberg states of atoms. After almost twenty years this remains a hot topic of modern atomic physics. Such studies are important for many areas of physics and its applications including spectroscopy, astrophysics and radio astronomy, physics of electronic and atomic collisions, kinetics and diagnostics of gases and low and high temperature plasmas. Physical phenomena in radiative collisional and spectral line broadening processes involving Rydberg atoms and ions are primarily determined by the peculiar properties and exotic features of highly excited states. The growth of interest and research activity in the physics of Rydberg the last two decades was stimulated by an extremely rapid development of high resolution laser spectroscopy methods of selective excitation and detection of highly excited states, atomic beam techniques as well as radio astronomy. This has facilitated significant progress in the different directions of the physics of highly excited atoms being of fundamental and practical importance. In particular, evident advances were achieved in studies of the structure and spectra of highly excited atoms, their behavior in static electric and magnetic fields, interactions with electromagnetic radiation, spectral line broadening and the shift of Rydberg series, collisions with electrons, ions, atoms and molecules, etc. The principle objective of the present book is to reflect the most important physical approaches and efficient theoretical techniques in the modern physics of highly excited atoms and ions.

Atom, Molecule, and Cluster Beams I Hans Pauly, 2012-12-06 A consistent up to date description of the extremely manifold and varied experimental techniques which nowadays enable work with neutral particles. The book lays the physical foundations of the various experimental techniques which utilize methods from most fields in physics.

Atoms, Molecules and Optical Physics 2 Ingolf V. Hertel, Claus-Peter Schulz, 2014-10-22 This is the second volume of textbooks on atomic, molecular and optical physics aiming at a comprehensive presentation of this highly productive branch of modern physics as an indispensable basis for many areas in physics and chemistry as well as in state of the art bio and material sciences. It primarily addresses advanced students including PhD students but in a number of selected subject areas the reader is led up to the frontiers of present research. Thus even the active scientist is addressed. This volume 2 introduces lasers and quantum optics while the main focus is on the structure of molecules and their spectroscopy as well as on collision physics as the continuum counterpart to bound molecular states. The emphasis is always on the experiment and its interpretation while the necessary theory is introduced from this perspective in a compact and occasionally somewhat heuristic manner, easy to follow even for beginners.

Selected Papers of Robert S. Mulliken Robert S. Mulliken, 1975-08 This book brings together in one volume the most important papers of Robert S. Mulliken who was awarded the 1966 Nobel Prize in chemistry for his seminal work on chemical bonds and the electronic

structures of molecules The papers collected here range from suggestive to closely detailed analyses of various topics in the theory of spectra and electronic structure of diatomic and polyatomic molecules Professor Mulliken has written introductory commentaries on each of the volume's seven parts Included in the volume are essays of general as well as scientific interest they are grouped under thematic headings Part I contains those papers which are of historical significance An autobiographical piece by Dr Mulliken offers a glimpse of the many famous people whom he has known Also reprinted is the text of his Nobel Prize acceptance speech At the end is a list of his students and other co workers and a complete bibliography of his papers Part II includes Mulliken's work on band spectra and chemistry as well as his research on the assignment of quantum numbers for electrons in molecules Part III surveys the author's early work on the bonding power of electrons and the method of molecular orbitals Included is a discussion of the structure and spectra of a number of important types of molecules The papers in part IV focus on the intensities of electronic transitions in molecular spectra This incorporates Mulliken's work on charge transfer and the halogen molecule spectra The problems addressed in part V center on the spectra and structure of polyatomic molecules Reprinted here is a report which Mulliken prepared on notation for polyatomic molecules Part VI is devoted to the problem of hyperconjugation These papers develop and apply the concept of hyperconjugation and explore its relation to the concept of conjugation The last part offers some of the most important papers from the author's postwar publications The central focus is on molecular orbital theory the area in which Mulliken's Nobel winning discoveries were made

Atom, Molecule, and Cluster Beams II Hans Pauly, 2013-04-17 This book completes the physical foundations and experimental techniques described in volume 1 with an updated review of the accessory equipment indispensable in molecular beam experiments It extends the subject to cluster beams and beams of hyperthermal and subthermal energies

Connerade, J.M. Esteva, R.C. Karnatak, 2013-12-20 Often a new area of science grows at the confines between recognised subject divisions

drawing upon techniques and intellectual perspectives from a diversity of fields Such growth can remain unnoticed at first until a characteristic family of effects described by appropriate key words has developed at which point a distinct subject is born Such is very much the case with atomic giant resonances For a start their name itself was borrowed from the field of nuclear collective resonances The energy range in which they occur at the juncture of the extreme UV and the soft X rays remains to this day a meeting point of two different experimental techniques the grating and the crystal spectrometer The impetus of synchrotron spectroscopy also played a large part in developing novel methods described by many acronyms which are used to study giant resonances today Finally although we have described them as atomic to differentiate them from their counterparts in Nuclear Physics their occurrence on atomic sites does not inhibit their existence in molecules and solids In fact giant resonances provide a new unifying theme cutting across some of the traditional scientific boundaries After much separate development the spectroscopies of the atom in various environments can meet afresh around this theme of common interest Centrifugal barrier effects and giant resonances proper emerged almost simultaneously in the late 1960 s from two widely separated areas of physics namely the study of free atoms and of condensed matter

The Role of Rydberg States in Spectroscopy and Photochemistry

C. Sándorfy, 2006-04-11 The aim of this volume is to offer a balanced overview of molecular Rydberg spectroscopy as it has developed over recent decades Recent evolution has split Rydberg spectroscopy into two apparently distinct fields the one concerns the low n 3 5 Rydberg states the other the very high typically EMn EM 150 Rydberg states The former is aimed at spectral levels where Rydberg valence shell and intermediate type states interact with a variety of photochemical consequences The latter considers states extremely close to the ionization limit from where ionization is possible with a very slight amount of additional energy Recently developed techniques make it possible to produce ions in well defined electronic vibrational and rotational states including states resulting from spin orbit or Jahn Teller splitting It is then possible to study the structure and reactions of such state selected ions as well as those of the corresponding neutral molecules These techniques amount to badly needed high resolution photoelectron spectroscopy
