Laboratory Psychology Julia Nunn, 1998 Experimental design is important enough to merit a book on its own without statistics that instead links methodology to a discussion of how psychologists can advance and reject theories about human behaviour The objective of this book is to fulfil this role The first four chapters lay the foundations of design in experimental psychology The first chapter justifies the prominent role given to methodology within the discipline whilst chapters two and three describe between subject and within subject designs Chapter four compares and contrasts the traditional experimental approach with that of the quasi experimental or correlational approach concluding that the consequences of not recognizing the value of the latter approach can be far reaching The following three chapters discuss practical issues involved in running experiments The first of these offers a comprehensive guide to the student researcher who wants to construct a good questionnaire including a discussion of reliability and validity issues The next chapter considers the basic tools of psychological research whilst both discussing the theoretical problem of how a sample from a population is chosen and offering useful hints on the practical issue of finding adequate populations from which to select participants The next chapter considers ethical practice within psychological research written in large part so that psychology students will be better able to anticipate ethical problems in their studies before they occur The final two chapters consider reporting and reading psychological papers Chapter eight details what should and should not be included in a laboratory report The contributors use their collective experience of marking numerous lab reports to highlight common errors and provide solutions Finally chapter nine describes the various elements of a journal article including tips on how to get the best out of your journal reading **The SAGE Encyclopedia of Communication Research Methods** Mike Allen, 2017-04-11 Communication research is evolving and changing in a world of online journals open access and new ways of obtaining data and conducting experiments via the Internet Although there are generic encyclopedias describing basic social science research methodologies in general until now there has been no comprehensive A to Z reference work exploring methods specific to

Practitioner's Guide to Evaluating Change with Intellectual Assessment Instruments Robert J.

McCaffrey,Holly James Westervelt,2013-03-14 While conducting research on intellectual and neuropsychological performance of various patient populations across time we became aware of the lack of information concerning practice effects associated with many widely used assessment instruments Although test retest data were available for almost all of these instruments it typically came in the form of correlation coefficients and mean changes in performance between assessments was often absent In a 1995 article McCaffrey Westervelt 1995 we discussed a number of issues relevant to serial neuropsychological and intellectual assessment and concluded that clinical neuropsychological practitioners had few guidelines to assist them in interpreting change in a patient s performance across assessments This volume represents our efforts at reviewing the literature between 1970 and 1998 and extracting the reported information on practice effects The tables include the assessment instrument used information on the subject patient groups the sample size fu gender age intervention interval between the assessments scores at both assessment points and the citation The tables reflect the existing published literature within intellectual assessment and therefore some instruments e g Wechsler tests comprise a majority of the tables whereas others e g Raven s Progressive Matrices Stanford Binet do not The test index is arranged by the name of the test as reported in the specific article We caution readers to refer to the original articles if additional or more specific information is needed

Neuropsychology Gerald Goldstein, Paul David Nussbaum, Sue R. Beers, 2013-06-29 In this volume of the series Human Brain Function Assessment and Rehabilitation we cover the area of how brain function is assessed with behavioral or neuropsychological instruments These assessments are typically conducted by clinical neuropsychologists or behavioral neurologists and so we made an effort to present the somewhat differing approaches to these two related disciplines Clinical neuropsychologists are psychologists who typically utilize standardized tests while behavioral neurologists are physicians who generally assess brain function as part of the clinical neurological evaluation Both approaches have much to offer The basic assumption of neuropsychological assessment is that the brain is the organ of behavior and therefore the condition of the brain may be evaluated with behavioral measures Neuropsychological tests are those measures found by research to be particularly sensitive to alterations in brain function An adequate neuropsychological test is a procedure that can be related to some objective measure of alteration in brain function Over the years these objective measures have changed but generally involve documentation through direct observation of brain tissue

or through histological pathological neuroimaging or other laboratory procedures The methods described in the first two volumes of this series describe the neuroimaging procedures that are often used in the validation of neuropsychological tests
