

Reflection Electron Microscopy and Spectroscopy for Surface Analysis

by Zhong Lin Wang

Introduction

In 1986, E. Ruska was awarded the Nobel Physics Prize for his pioneering work of building the world's first transmission electron microscope (TEM) in the late 1920's. The mechanism of TEM was originally based on the physical principle that a charged particle could be focused by magnetic lenses, so that a "magnifier" similar to an optic microscope could be built. The discovery of wave properties of electrons really revolutionized people's understanding about the potential applications of an TEM. In the last 60 years TEM has experienced a revolutionary development both in theory and electron optics, and has become one of the key research tools for materials characterization (Hirsch et al., 1956; Buseck et al., 1989). The point-to-point image resolution currently available in TEM is better than 0.2 nm, comparable to the interatomic distances in solids.

High resolution TEM is one of the key techniques for real-space imaging of defect structures in crystalline materials. Quantitative structure determination is becoming feasible, particularly with the following technical advances. The installation of an energy-filtering system on an TEM has made it possible to form images and diffraction patterns using electrons with different energy-losses. Accurate structure analysis is possible using the purely elastically scattered electrons, the scattering of which can be exactly simulated using the available theories. The traditional method of recording images on film is being replaced by digital imaging with the use of a charge coupled device (CCD) camera, which has a large dynamical range with single electron detection sensitivity. Thus, electron diffraction patterns and images can be recorded linearly in intensity, and a quantitative fitting is feasible between an experimentally observed image and a theoretically simulated image. This is the future direction of electron microscopy, which allows quantitative structure determination with an accuracy to be comparable to x-ray diffraction. A modern TEM is a versatile machine which not only can explore the crystal structure using imaging and diffraction techniques but also can perform high-spatial resolution

Surface Analysis Methods in Materials Science D.J. O'Connor, Brett A. Sexton, Roger St.C. Smart, 2013-04-17 The idea for this book stemmed from a remark by Philip Jennings of Murdoch University in a discussion session following a regular meeting of the Australian Surface Science group He observed that a text on surface analysis and applications to materials suitable for final year undergraduate and postgraduate science students was not currently available Furthermore the members of the Australian Surface Science group had the research experience and range of coverage of surface analytical techniques and applications to provide a text for this purpose A list of techniques and applications to be included was agreed at that meeting The list intended readership of the book has been broadened since the early discussions particularly to encompass industrial users but there has been no significant alteration in content The editors in consultation with the contributors have agreed that the book should be prepared for four major groups of readers senior undergraduate students in chemistry physics metallurgy materials science and materials engineering postgraduate students undertaking research that involves the use of analytical techniques groups of scientists and engineers attending training courses and workshops on

the application of surface analytical techniques in materials science industrial scientists and engineers in research and development seeking a description of available surface analytical techniques and guidance on the most appropriate techniques for particular applications The contributors mostly come from Australia with the notable exception of Ray Browning from Stanford University

Surface Analysis Methods in Materials Science John O'Connor, 2003-04-23 This guide to the use of surface analysis techniques now in its second edition has expanded to include more techniques current applications and updated references It outlines the application of surface analysis techniques to a broad range of studies in materials science and engineering The book consists of three parts an extensive introduction to the concepts of surface structure and composition a techniques section describing 19 techniques and a section on applications This book is aimed at industrial scientists and engineers in research and development The level and content of this book make it ideal as a course text for senior undergraduate and postgraduate students in materials science materials engineering physics chemistry and metallurgy

Ion Spectroscopies for Surface Analysis Alvin W. Czanderna, David M. Hercules, 2012-12-06 Determining the elemental composition of surfaces is an essential measurement in characterizing solid surfaces At present many approaches may be applied for measuring the elemental and molecular composition of a surface Each method has particular strengths and limitations that often are directly connected to the physical processes involved Typically atoms and molecules on the surface and in the near surface region may be excited by photons electrons ions or neutrals and the detected particles are emitted ejected or scattered ions or electrons The purpose of this book is to bring together a discussion of the surface compositional analysis that depends on detecting scattered or sputtered ions and the methods emphasized are those where instruments are commercially available for carrying out the analysis For each topic treated the physical principles instrumentation qualitative analysis artifacts quantitative analysis applications opportunities and limitations are discussed The first chapter provides an overview of the role of elemental composition in surface science compositional depth profiling stimulation by an electric field electrons neutrals or photons and detection of ions and then stimulation by ions and detection of ions electrons photons or neutrals
