Reformulation Linearization Technique For Solving Discrete And Continuous Nonconvex Problems:

A Reformulation-Linearization Technique for Solving Discrete and Continuous Nonconvex Problems Hanif D. Sherali, W. P. Adams, 2013-04-17 This book deals with the theory and applications of the Reformulation Linearization Convexification Technique RL T for solving nonconvex optimization problems A unified treatment of discrete and continuous nonconvex programming problems is presented using this approach In essence the bridge between these two types of nonconvexities is made via a polynomial representation of discrete constraints For example the binariness on a 0 1 variable x can be equivalently expressed as the polynomial constraint $x^2 - x = 0$ The motivation for this book is the role of tight linear convex programming representations or relaxations in solving such discrete and continuous nonconvex programming problems The principal thrust is to commence with a model that affords a useful representation and structure and then to further strengthen this representation through automatic reformulation and constraint generation techniques As mentioned above the focal point of this book is the development and application of RL T for use as an automatic reformulation procedure and also to generate strong valid inequalities The RLT operates in two phases In the Reformulation Phase certain types of additional implied polynomial constraints that include the aforementioned constraints in the case of binary variables are appended to the problem The resulting problem is subsequently linearized except that certain convex constraints are sometimes retained in particular special cases in the Linearization Convexification Phase This is done via the definition of suitable new variables to replace each distinct variable product term The higher dimensional representation yields a linear or convex programming relaxation

Stochastic and Global Optimization G. Dzemyda, V. Saltenis, A. Žilinskas, 2006-04-11 In the paper we propose a model of tax incentives optimization for investment projects with a help of the mechanism of accelerated depreciation Unlike the tax holidays which influence on effective income tax rate accelerated depreciation affects on taxable income In modern economic practice the state actively use for an attraction of investment into the creation of new enterprises such mechanisms as accelerated depreciation and tax holidays The problem under our consideration is the following Assume that the state region is interested in realization of a certain investment project for example the creation of a new enterprise In order to attract a potential investor the state decides to use a mechanism of accelerated tax depreciation The following question arise What is a reasonable principle for choosing depreciation rate From the state's point of view the future investor's behavior will be rational It means that while looking at economic environment the investor choose such a moment for investment which maximizes his expected net present value NPV from the given project For this case both criteria and investment rule depend on proposed by the state depreciation policy For the simplicity we will suppose that the purpose of the state for a given project is a maximization of a discounted tax payments into the budget from the enterprise after its creation Of course these payments depend on the moment of investor's entry and therefore on the depreciation policy established by the state
