Longevity: To the Limits and Beyond Jean-Marie Robine, James W. Vaupel, Bernard Jeune, Michel Allard, 2012-12-06 Why longevity For a number of years the Fondation IPSEN has been devoting considerable effort to the various aspects of ageing not only to age related diseases such as Alzheimer's but also to the Centenarians the paragon of positive ageing The logical continuation of this approach is to address the question of longevity in global terms Behind the extreme values what span is accessible to all of us and likely to directly concern most of our contemporaries The individual and collective increase in the duration of life is one of the most striking phenomena of our time It could be one of the most significant events in the bio social history of humanity The increase in life expectancy at old age which started a few decades ago only is going on The most well advised observer had not foreseen or even dared hope for this increase which will drastically affect our everyday life our habits and our behavior In the fragment of human history we are living in it is our responsibility to deal with this major transformation for the species Such a transformation needs an effort from all to adapt to the new conditions This transformation has to be managed rather than simply experienced anticipated rather than followed in order to avoid any attempt to pervert this major step forward All that was present during the first symposium of the new series on longevity of the Colloques Medecine et Recherche convened by the Fondation IPSEN

**Pathways to the Development of the Aging Phenotype** John Papaconstantinou, Pathways to the Development of the Aging Phenotype explores the journey that all living things must eventually take Using the definition that aging is a multifactorial syndrome caused by multiple pathophysiological processes that occur simultaneously in multiple tissues of the aged Dr John Papaconstantinou provides a wholistic look at aging its causes how it presents and how aging syndromes can be treated In addition this book offers a deeper look at the effects of aging on individual organs The aging heart skeletal muscle

eye skin kidney intestine liver pancreas and adipose tissue are all covered as well as an examination of the aging brain and neurodegenerative diseases such as Alzheimer's ALS Parkinson's and Huntington's disease Other important subjects covered are the effects of social isolation and loneliness on aging as well as the effects of sleep and other lifestyle choices Throughout the book Dr Papaconstantinou provides information on current and promising research on aging and the treatment of aging syndromes as well as the recent exciting work on tissue regeneration that suggests aged tissues and organs can be reprogrammed to a juvenile phenotype Pathways to the Development of the Aging Phenotype is an exciting addition to scientific and medical literature related to aging and will be an invaluable resource for medical students professionals and researchers looking to expand their knowledge in this field

Growth Vaclav Smil, 2020-12-08 A systematic investigation of growth in nature and society from tiny organisms to the trajectories of empires and civilizations Growth has been both an unspoken and an explicit aim of our individual and collective striving It governs the lives of microorganisms and galaxies it shapes the capabilities of our extraordinarily large brains and the fortunes of our economies Growth is manifested in annual increments of continental crust a rising gross domestic product a child's growth chart the spread of cancerous cells In this magisterial book Vaclav Smil offers systematic investigation of growth in nature and society from tiny organisms to the trajectories of empires and civilizations Smil takes readers from bacterial invasions through animal metabolisms to megacities and the global economy He begins with organisms whose mature sizes range from microscopic to enormous looking at disease causing microbes the cultivation of staple crops and human growth from infancy to adulthood He examines the growth of energy conversions and man made objects that enable economic activities developments that have been essential to civilization Finally he looks at

growth in complex systems beginning with the growth of human populations and proceeding to the growth of cities He considers the challenges of tracing the growth of empires and civilizations explaining that we can chart the growth of organisms across individual and evolutionary time but that the progress of societies and economies not so linear encompasses both decline and renewal The trajectory of modern civilization driven by competing imperatives of material growth and biospheric limits Smil tells us remains uncertain

*Neuronal Inputs and Outputs of Aging and Longevity* Joy Alcedo, Thomas Flatt, Elena G. Pasyukova, 2013-08-23 An animal's survival strongly depends on its ability to maintain homeostasis in response to the changing quality of its external and internal environments This is achieved through intercellular communication not only within a single tissue but also among different tissues and organ systems Thus alterations in tissue to tissue or organ to organ communications which are under genetic regulation can affect organismal homeostasis and consequently impact the aging process One of the organ systems that play a major role in maintaining homeostasis is the nervous system Considering that the nervous system includes the sensory system which perceives the complexity of an animal's environment it should be no surprise that there would be a sensory influence on homeostasis and aging To promote homeostasis any given sensory information is transmitted through short range signals via neural circuits and or through long range endocrine signals to target tissues which may in turn be neuronal or non neuronal in nature At the same time since homeostasis involves a number of feedback mechanisms non neuronal tissues can also modulate sensory and other neuronal functions Several genes that regulate signaling pathways known to affect homeostasis and aging have been shown to act in neurons in tissues that are likely downstream targets of the nervous system or through feedback regulation of neuronal activities These genes can have different temporal requirements some might function early e g by affecting neural development while others may only be required later in adulthood Some well known examples of genes involved in the neuronal regulation of homeostasis and longevity encode components of the evolutionarily conserved nutrient sensing insulin like signaling pathway the stress sensing internal repair system and the mitochondrial electron transport chain Indeed the genetic perturbation of these pathways has been found to lead to numerous diseases many of which are age related and involve the nervous system such as neurodegeneration and the

metabolic syndrome Despite much progress however many aspects of the neuronal inputs and outputs that affect aging and longevity are poorly understood to date For example the precise neuronal and non neuronal circuitries and the details of the molecular mechanisms through which genes signaling pathways maintain homeostasis and affect aging in response to the environment remain to be elucidated Similarly it is presently unclear whether genes that regulate the early development of the nervous system and its consequent circuitry influence homeostasis and longevity during adulthood At the same time although many genes affecting aging are conserved both the nervous system and the aging process are highly variable within populations and among taxa Accordingly the role of natural genetic variation in shaping the neurobiology of aging is also presently unknown The aim of this Research Topic is therefore to highlight the genetic developmental and physiological aspects of the signaling networks that mediate the neuronal inputs and outputs that are required to maintain organismal homeostasis The elucidation of the effects of these neuronal activities on homeostasis may thus provide much needed insight into mechanisms that affect aging and longevity

**A Protocol to Determine Seed Storage Behaviour** T. D. Hong,R. H. Ellis,1996 This publication provides an approach by which conservationists can determine whether or not long term seed storage is feasible for a particular species i e whether or not that species shows orthodox seed storage behaviour and provides advice on the implementation of the protocol examples of ways in which the results from seed storage studies could be misinterpreted due to confounding factors as well as several alternative approaches for estimating seed storage behaviour prior to carryng out actual investigations with the seeds In particular the latter section introduces the concept of a multicriteria approach for estimating seed storage behaviour
