

# A Self Recovery Approach Using Halftone Images for Medical Imagery System

John Blawiecin, Rama and Jennifer Jostlin, Kurupya University, India

**Abstract**— Security has become an inseparable issue even in the field of medical applications. Communication in medicine and healthcare is very important. The fast growth of the exchange traffic in medical imagery on the Internet justifies the creation of adapted tools guaranteeing the quality and the confidentiality of the information while respecting the legal and ethical parameters, specific to this field. Visual Cryptography is the study of mathematical techniques related aspects of Information Security which allows Visual Information to be encrypted in such a way that their decryption can be performed by the human visual system, without any complex cryptographic algorithms. This technique represents the secret image by several different shares of binary images. It is hard to perceive any share about a secret image from individual shares. The secret message is revealed when parts or all of these shares are aligned and stacked together. In this paper we provide an overview of the emerging Visual Cryptography (VC) techniques used in the secure transfer of the medical images over the Internet. The related work is based on the recovering of secret image using a binary logo which is used to represent the ownership of the host image which generates shares by visual cryptography algorithms. An error correction-coding scheme is also used to create the appropriate shares. The logo extracted from the halftoned host image identifies the cheating types. Furthermore, the logo removes the reconstructed image when shares is being checked using an image self-verification scheme based on the Blakesh technique which checks the halftone logo for effective self verification of the reconstructed secret image without the need for the trusted third party(TTP).

## I. INTRODUCTION

THE rapid advancement of network technology, multimedia information is transmitted over the Internet conveniently. Nowadays, the transmission of medical information has become very convenient due to the generality of Internet. The current needs in medical imaging security come mainly from the development of the traffic on Internet (tele-radiology, tele-medicine) and to establishment of medical personal file. Various confidential data such as the secret transfer medical images are transmitted over the Internet. Internet has created the biggest benefit to achieve the transmission of patient information efficiently. However, it is

clear that the hackers can grab or duplicate the medical information on the Internet. While using secret images, security issues should be taken into consideration because hackers may utilize this weak link over communication network to steal the information that they want. To deal with the security problems of secret images, various image secret sharing schemes have been developed.

Visual cryptography scheme [4] eliminates complex computation problems in decryption process thus enabling the transfer of medical images in a more convenient, easy and secure way. Even with the remarkable advances of computer technology, using a computer to decrypt secrets is infeasible in some situations. For example, a security guard checks the badge of an employee or a secret agent recovers an urgent secret at some place where no electronic devices are applied. In these situations the human visual system is one of the most convenient and reliable tools to do checking and secret recovery. Visual cryptography (VC), proposed by Naor and Shamir [1], is a method for protecting image-based secrets that has a computation-free decryption process.

If 'p' is white, one of the two columns under the white pixel in Figure 1 is selected. If p is black, one of the two columns under the black pixel is selected. In each case, the selection is performed randomly such that each column has 50% probability to be chosen. Then, the first two pairs of sub pixels in the selected columns are assigned to share 1 and share 2, respectively. Thus, in each share, p is encrypted into a black-white or white-black pair of sub pixels, an individual share gives no clue about the secret image [7].
