Partial Connections:

Partial Connections Marilyn Strathern, 2004 Updated with a new Preface this seminal work challenges the routine ways in which anthropologists have thought about the complexity and quantity of their materials Marilyn Strathern focuses on a problem normally regarded as commonplace that of scale and proportion She combines a wide ranging interest in current theoretical issues with close attention to the cultural details of social life attempting to establish proportionality between them Strathern gives equal weight to two areas of contemporary debate The difficulties inherent in anthropologically representing complex societies and the future of cross cultural comparison in a field where too much seems known The ethnographic focus of this book emphasizes the context through which Melanesianists have managed the complexity of their own accounts while at the same time unfolding a commentary on perception and the mixing of indigenous forms Revealing unexpected replications in modes of thought and in the presentation of ambiguous images Strathern has fashioned a unique contribution to the anthropological corpus This book was originally published under the sponsorship of the Association for Social Anthropology in Oceania

Parabolic Geometries I Andreas Čap, Jan Slovák, 2024-07-29 Parabolic geometries encompass a very diverse class of geometric structures including such important examples as conformal projective and almost quaternionic structures hypersurface type CR structures and various types of generic distributions The characteristic feature of parabolic geometries is an equivalent description by a Cartan geometry modeled on a generalized flag manifold the quotient of a semisimple Lie group by a parabolic subgroup Background on differential geometry with a view towards Cartan connections and on semisimple Lie algebras and their representations which play a crucial role in the theory is collected in two introductory chapters The main part discusses the equivalence between Cartan connections and underlying structures including a complete proof of Kostant's version of the Bott Borel Weil theorem which is used as an important tool For many examples the complete description of the geometry and its basic

invariants is worked out in detail The constructions of correspondence spaces and twistor spaces and analogs of the Fefferman construction are presented both in general and in several examples The last chapter studies Weyl structures which provide classes of distinguished connections as well as an equivalent description of the Cartan connection in terms of data associated to the underlying geometry Several applications are discussed throughout the text Mathematical

Flato, 2012-12-06 On the occasion of the sixtieth birthday of Andre Lichnerowicz a number of his friends many of whom have been his students or coworkers decided to celebrate this event by preparing a jubilee volume of contributed articles in the two main fields of research marked by Lichnerowicz's work namely differential geometry and mathematical physics

Limitations of space and time did not enable us to include papers from all Lichnerowicz's friends nor from all his former students It was equally impossible to reflect in a single book the great variety of subjects tackled by Lichnerowicz In spite of these limitations we hope that this book reflects some of the present trends of fields in which he worked and some of the subjects to which he contributed in his long and not yet finished career This career was very much marked by the influence of his masters Elie Cartan who introduced him to research in mathematics mainly in geometry and its relations with mathematical physics and Georges Darmon who developed his interest for mechanics and physics especially the theory of relativity and electromagnetism This particular combination and his personal talent made of him a natural scientific heir and continuator of the French mathematical physics school in the tradition of Henri Poincaré Some of his works would even be best qualified by a new field name that of physical mathematics branches of pure mathematics entirely motivated by physics

The Geometry of Four-manifolds S. K. Donaldson, P. B. Kronheimer, 1997 This book provides the first lucid and accessible account of the modern study of the geometry of four manifolds It presents both a thorough treatment of the main lines of the developments and also a wide ranging treatment of relevant topics from geometry and global analysis *Against Value in the Arts and Education* Sam Ladkin, Robert McKay, Emile Bojesen, 2016-05-18 *Against Value in the Arts and Education* proposes that it is often the staunchest defenders of art who do it the most harm by suppressing or mollifying its dissenting voice by neutralizing its painful truths and by instrumentalizing its ambivalence The result is that rather than expanding the autonomy of thought and feeling of the artist and the audience art's defenders make art self satisfied or

otherwise an echo chamber for the limited and limiting self description of people s lives lived in an audit culture a culture pervaded by the direct and indirect excrescence of practices of accountability This book diagnoses the counter intuitive effects of the rhetoric of value It posits that the auditing of values pervades the fabric of people s work lives their education and increasingly their everyday experience The book uncovers figures of resentment disenchantment and alienation fostered by the dogma of value It argues instead that value judgments can behave insidiously and incorporate aesthetic ethical or ideological values fundamentally opposed to the value they purportedly name and describe The collection contains contributions from leading scholars in the UK and US with contributions from anthropology the history of art literature education musicology political science and philosophy *Official Gazette of the United States Patent Office* United States. Patent Office,1916

Alter(ed) Bodies Mateusz Borowski, Małgorzata Sugiera,2025-07-14 The fundamental assumption behind the volume is that the current civilizational crisis manifested in such phenomena as climate change environmental catastrophes pandemics and wars puts into question the biopolitical means of optimizing the life of populations and individuals To narrow down the thematic concerns of the volume the chapters are centered around the notion of body fundamental for the majority of theoretical takes on biopolitics The volume shows that in the current age of catastrophes bodies are not only shaped and individualized through procedures of institutionalized discipline but by an entanglement of environmental and planetary factors typically omitted in extant accounts of biopolitics The chapters go beyond biopolitics because they show bodies as sites of operation of non human or more than human agencies that work on scales inaccessible to human sensorium

Broadband Communications Danny H.K. Tsang,Paul J. Kühn,1999-10-31 Broadband communications is widely recognized as one of the key technologies for building the next generation global network infrastructure to support ever increasing multimedia applications This book contains a collection of timely leading edge research papers that address some of the important issues of providing such a broadband network infrastructure Broadband Communications represents the selected proceedings of the Fifth International Conference on Broadband Communications sponsored by the International Federation for Information Processing IFIP and held in Hong Kong in November 1999 The book is organized according to the eighteen technical sessions of the conference The topics covered include internet services traffic modeling internet traffic control performance evaluation billing pricing admission policy mobile network protocols TCP IP performance mobile network performance bandwidth allocation switching systems traffic flow control routing congestion and admission control multicast protocols network management and quality of service It will serve as an essential reference for computer scientists and practitioners

Discrete Geometry and Mathematical Morphology Étienne Baudrier,Benoît Naegel,Adrien Krähenbühl,Mohamed Tajine,2022-10-20 This book constitutes the proceedings of the Second IAPR International Conference on Discrete Geometry and Mathematical Morphology DGMM 2022 which was held during October 24 27 2022 in Strasbourg France The 33 papers included in this volume were carefully reviewed and selected from 45 submissions They were

organized in topical sections as follows discrete and combinatorial topology discrete tomography and inverse problems multivariate and PDE based mathematical morphology morphological filtering hierarchical and Graph Based Models Analysis and Segmentation discrete geometry models transforms and visualization learning based morphology to Mathematical Morphology and distance transform The book also contains 3 invited keynote papers **After Method** John Law,2004-08-12 John Law argues that methods don't just describe social realities but are also involved in creating them The implications of this argument are highly significant If this is the case methods are always political and it raises the question of what kinds of social realities we want to create Most current methods look for clarity and precision It is usually said that only poor research produces messy findings and the idea that things in the world might be fluid elusive or multiple is unthinkable Law's startling argument is that this is wrong and it is time for a new approach Many realities he says are vague and ephemeral If methods want to know and help to shape the world then they need to reinvent themselves and their politics to deal with mess That is the challenge Nothing less will do **Complex Analytic Geometry: From The Localization Viewpoint** Tatsuo Suwa,2024-02-21 Complex Analytic Geometry is a subject that could be termed in short as the study of the sets of common zeros of complex analytic functions It has a long history and is closely related to many other fields of Mathematics and Sciences where numerous applications have been found including a recent one in the Sato hyperfunction theory This book is concerned with among others local invariants that arise naturally in Complex Analytic Geometry and their relations with global invariants of the manifold or variety The idea is to look at them as residues associated with the localization of some characteristic classes Two approaches are taken for this topological and differential geometric and the combination of the two brings out further fruitful results For this on one hand we present detailed description of the Alexander duality in combinatorial topology On the other hand we give a thorough presentation of the de Rham cohomology and integration theory on it This viewpoint provides us with the way for clearer and more precise presentations of the central concepts as well as fundamental and important results that have been treated only globally so far It also brings new perspectives into the subject and leads to further results and applications The book starts off with basic material and continues by introducing characteristic classes via both the obstruction theory and the Chern Weil theory explaining the idea of localization of characteristic classes and presenting the aforementioned invariants and relations in a unified way from this perspective Various related topics are also discussed The expositions are carried out in a self containing manner and includes recent developments The profound consequences of this subject will make the book useful for students and researchers in fields as diverse as Algebraic Geometry Complex Analytic Geometry Differential Geometry Topology Singularity Theory Complex Dynamical Systems Algebraic Analysis and Mathematical Physics Mathematical Morphology Laurent Najman,Hugues Talbot,2013-01-24 Mathematical Morphology allows for the analysis and processing of geometrical structures using techniques based on the fields of set theory lattice theory topology and random functions It is the basis of morphological

image processing and finds applications in fields including digital image processing DSP as well as areas for graphs surface meshes solids and other spatial structures This book presents an up to date treatment of mathematical morphology based on the three pillars that made it an important field of theoretical work and practical application a solid theoretical foundation a large body of applications and an efficient implementation The book is divided into five parts and includes 20 chapters The five parts are structured as follows Part I sets out the fundamental aspects of the discipline starting with a general introduction followed by two more theory focused chapters one addressing its mathematical structure and including an updated formalism which is the result of several decades of work Part II extends this formalism to some non deterministic aspects of the theory in particular detailing links with other disciplines such as stereology geostatistics and fuzzy logic Part III addresses the theory of morphological filtering and segmentation featuring modern connected approaches from both theoretical and practical aspects Part IV features practical aspects of mathematical morphology in particular how to deal with color and multivariate data links to discrete geometry and topology and some algorithmic aspects without which applications would be impossible Part V showcases all the previously noted fields of work through a sample of interesting representative and varied applications

Structures and Their Analysis Maurice Bernard Fuchs, 2016-05-09 Addressing structures this book presents a classic discipline in a modern setting by combining illustrated examples with insights into the solutions It is the fruit of the author's many years of teaching the subject and of just as many years of research into the design of optimal structures Although intended for an advanced level of instruction it has an undergraduate course at its core Further the book was written with the advantage of having massive computer power in the background an aspect which changes the entire approach to many engineering disciplines and in particular to structures This paradigm shift has dislodged the force flexibility method from its former prominence and paved the way for the displacement stiffness method despite the multitude of linear equations it spawns In this book however both methods are taught the force method offers a perfect vehicle for understanding structural behavior bearing in mind that it is the displacement method which does the heavy number crunching As a rule the book keeps things as simple as possible conveying the basic ideas and refraining from lengthy calculations wherever possible Further it endeavors to unify the approach showing that whatever applies to simple springs is equally valid for intricate frames In addition to various design considerations it also addresses several topics relating to optimal structures that will be of interest to students and teachers of structures

Asymptotically Symmetric Einstein Metrics Olivier Biquard, 2006 The correspondence between Einstein metrics and their conformal boundaries has recently been the focus of great interest This is particularly so in view of the relation with the physical theory of the AdS CFT correspondence In this book this correspondence is seen in the wider context of asymptotically symmetric Einstein metrics that is Einstein metrics whose curvature is asymptotic to that of a rank one symmetric space There is an emphasis on the correspondence between Einstein metrics and geometric structures on their boundary at infinity conformal structures CR

structures and quaternionic contact structures introduced and studied in the book Two new constructions of such Einstein metrics are given using two different kinds of techniques analytic methods to construct complete Einstein metrics with a unified treatment of all rank one symmetric spaces relying on harmonic analysis algebraic methods twistor theory to construct local solutions of the Einstein equation near the boundary

The Anthropology of Postindustrialism Ismael Vaccaro, Krista Harper, Seth Murray, 2015-10-08 This volume explores how mechanisms of postindustrial capitalism affect places and people in peripheral regions and de industrializing cities While studies of globalization tend to emphasize localities newly connected to global systems this collection in contrast analyzes the disconnection of communities away from the market presenting a range of ethnographic case studies that scrutinize the framework of this transformative process analyzing new social formations that are emerging in the voids left behind by the de industrialization and introducing a discussion on the potential impacts of the current economic and ecological crises on the hyper mobile model that has characterized this recent phase of global capitalism and spatially uneven development

Basic Principles of Power Electronics Klemens Heumann, 2012-12-06 Power electronics became an identifiably separate area of electrical engineering with the invention of the thyristor about 30 years ago The growing demand for controllability and conversion of electric energy has made this area increasingly important which in turn has resulted in new device circuit and control developments In particular new components such as the GTO and power MOSFET continue to extend power electronic technology to new applications The technology embodied by the name power electronics is complex It consists of both power level and signal level electronics as well as thermal mechanical control and protection systems The power circuit that part of the system actually processing energy can be thought of as an amplifier around which is placed a closed loop control system The goal of this book is to provide an easily understood exposition of the principles of power electronics Common features of systems and their behavior are identified in order to facilitate understanding Thyristor converters are distinguished and treated according to their mode of commutation Circuits for various converters and their controls are presented along with a description of ancillary circuits such as those required for snubbing and gate drives Thermal and electrical properties of semiconductor power devices are discussed The line converter and converter load interfaces are examined leading to some general statements being made about energy transfer Application areas are identified and categorized with respect to power and frequency ranges The many tables presented in the book provide an easily used reference source

Retrieving Experience Sonia Kruks, 2001 Situating the subject Panopticism and shame Foucault Beauvoir and feminism The politics of recognition Sartre Fanon and identity politics Identity politics and dialectical reason beyond an epistemology of provenance Going beyond discourse feminism phenomenology and women s experience Phenomenology and difference on the possibility of feminist world travelling

Care and the Pluriverse Maggie FitzGerald, 2024-01-16 A perennial debate in the field of global ethics revolves around the possibility of a universalist ethics as well as arguments over the nature and significance of

difference for moral deliberation Decolonial literature in particular increasingly signifies a pluriverse one with radical ontological and epistemological differences This book examines the concept of the pluriverse alongside global ethics and the ethics of care in order to contemplate new ethical horizons for engaging across difference Offering a challenge to the current state of the field this book argues for a rethinking of global ethics as it has been conceived thus far
