*Rabbit Biotechnology* Louis-Marie Houdebine, Jianglin Fan, 2009-04-24 Louis Marie Houdebine and Jianglin Fan The study of biological functions of proteins and their possible roles in the pathogenesis of human diseases requires more and more relevant animal models Although mice including genetically modified mice offer many possibilities other non murine species are absolutely required in some circumstances Rabbit is one of these species which has been widely used in biomedical studies This animal is genetically and physiologically closer to humans including cardiovascular system and metabolism characteristics Rabbit is thus more appropriate than mice to study some diseases such as atherosclerosis and lipid metabolism Because of its larger size surgery manipulation bleeding and turn over studies are much easier performed in rabbits than in mice Furthermore transgenic rabbits can be produced using microinjection and other methods such as lentiviral vectors Cloning in rabbits has been proved possible even though still laborious and time consuming Hopefully functional rabbit ES cell lines will be available in the coming years Gene deletion or knock out in rabbits will then become possible *General Technical Report RMRS*, 1998
