Molecular Electrochemistry of Inorganic, Bioinorganic and Organometallic Compounds A.J.L. Pombeiro, J.A. McCleverty, 2012-02-02 The use of electrochemical techniques by chemists particularly those who regard

themselves as inorganic coordination chemists has undergone a very rapid growth in the last 15 20 years The techniques as

basically applied to inorganic species had their origins in analytical chemistry and the methodology had assumed until the mid 60s more importance than the chemiStry However the growth of interest in coordination compounds including

organometallic complexes having unusually rich of electron transfer in bio inorganic redox properties and in the understanding species has propelfed electro chemistry into the foreground of potentially readily available techniques for application to a very wide range of problems of interest to those chemists This growth has been fuelled additionally by the availability of relatively cheap equipment of growing sophistication and by an increase in the inorganic chemists general knowledge of physical electrochemistry In particular with increasing availability and sophistication of eqUiipment kinetic

problems are now being addressed and the range of electrode types and configuration and solvents has been greatly expanded Furthermore the rapid expansion of interest in biological problems has opened new avenues in functionalisation of

electrodes in the development of sensory devices and in a sense a return to the analytical base of the science using novel and multi disciplinary techniques drawing on synthesis chemistry of and electronic micro engeneering The drive towards increasing use microcomputer controlled data analysis and the development of microeledrodes has opened exciting new avenues for the exploration of chemical reactions involving electron transfer processes

J. L. Bachmeier,2016-11-23 This thesis describes a series of investigations

designed to assess the value of metalloenzymes in systems for artificial and adapted photosynthesis. The research presented explores the interplay between inherent enzyme properties such as structure, rates and thermodynamics and the properties of the semiconducting materials to which the enzyme is attached. Author Andreas Bachmeier provides a comprehensive introduction to the interdisciplinary field of artificial photosynthesis allowing the reader to grasp the latest approaches being investigated from molecular systems to heterogeneous surface catalysis. Bachmeier's work also uses metalloenzymes to highlight the importance of reversible catalysts in removing the burden of poor electrocatalytic rates and efficiencies which are common characteristics for most artificial photosynthesis systems. Overall, this thesis provides newcomers and students in the field with evidence that metalloenzymes can be used to establish new directions in artificial photosynthesis research.
