Origin Of Species The Descent Of Man:

Descent of Man and Selection in Relation to Sex Charles Darwin, 2004 Excerpt from The Descent of Man and Selection in Relation to Sex The nature of the following work will be best understood by a brief account of how it came to be written During many years I collected notes on the origin or descent of man without any intention of publishing on the subject but rather with the determination not to publish as I thought that I should thus only add to the prejudices against my views It seemed to me sufficient to indicate in the first edition of my Origin of Species that by this work light would be thrown on the origin of man and his history and this implies that man must be included with other organic beings in any general conclusion respecting his manner of appearance on this earth Now the case wears a wholly different aspect When a naturalist like Carl Vogt ventures to say in his address as President of the National Institution of Geneva *personne en Europe au moins n'ose plus soutenir la création indépendante et de toutes pièces des espèces* it is manifest that at least a large number of naturalists must admit that species are the modified descendants of other species and this especially holds good with the younger and rising naturalists The greater number accept the agency of natural selection though some urge whether with justice the future must decide that I have greatly overrated its importance Of the older and honoured chiefs in natural science many unfortunately are still opposed to evolution in every form About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works *The Descent of Man* Charles Darwin, 1874 The Origin of Species by means of Natural Selection Charles Darwin, 2021-08-10 The Origin of Species by means of Natural Selection Charles Darwin The Origin is one of the most important books ever published and a knowledge of it should be a part of the intellectual equipment of every educated person The book will endure in future ages so long as a knowledge of science persists among mankind Nature It took Charles Darwin more than twenty years to publish this book in part because he realized that it would ignite a firestorm of controversy On the Origin of Species first appeared in 1859 and it remains a continuing source of conflict to this day Even among those who reject its ideas however the work's impact is undeniable In science philosophy and theology this is a book that changed the world In addition to its status as the focus of a dramatic turning point in scientific thought On the Origin of Species stands as a remarkably readable study Carefully reasoned and well documented in its arguments the work offers coherent views of natural selection adaptation the struggle for existence survival of the fittest and other concepts that form the foundation of modern evolutionary theory This volume is a reprint of the critically acclaimed first edition **The Origin of Species** Charles Darwin, 1998 A grain in the balance will

determine which individual shall live and which shall die *The Descent of Man* Charles Darwin, 2012-12-13 *The Descent of Man* *The Descent of Man* Charles Darwin, 2017-12-16 *The Descent of Man And Selection in Relation to Sex* Works by Charles Darwin F R S Life and Letters of Charles Darwin With an Autobiographical Chapter Edited by Francis Darwin Popular Edition The nature of the following work will be best understood by a brief account of how it came to be written During many years I collected notes on the origin or descent of man without any intention of publishing on the subject but rather with the determination not to publish as I thought that I should thus only add to the prejudices against my views It seemed to me sufficient to indicate in the first edition of my *Origin of Species* that by this work light would be thrown on the origin of man and his history and this implies that man must be included with other organic beings in any general conclusion respecting his manner of appearance on this earth Now the case wears a wholly different aspect When a naturalist like Carl Vogt ventures to say in his address as President of the National Institution of Geneva 1869 *personne en Europe au moins n ose plus soutenir la creation ind pendant et de toutes pieces des especes* it is manifest that at least a large number of naturalists must admit that species are the modified descendants of other species and this especially holds good with the younger and rising naturalists The greater number accept the agency of natural selection though some urge whether with justice the future must decide that I have greatly overrated its importance Of the older and honoured chiefs in natural science many unfortunately are still opposed to evolution in every form Charles Darwin 12 February 1809 19 April 1882 was an English naturalist geologist and biologist best known for his contributions to the science of evolution He established that all species of life have descended over time from common ancestors and in a joint publication with Alfred Russel Wallace introduced his scientific theory that this branching pattern of evolution resulted from a process that he called natural selection in which the struggle for existence has a similar effect to the artificial selection involved in selective breeding

The Descent of Man, and Selection in Relation to Sex Charles Darwin, 1872 *The Descent of Man, and Selection in Relation to Sex* Charles Darwin, 1981 In the current resurgence of interest in the biological basis of animal behavior and social organization the ideas and questions pursued by Charles Darwin remain fresh and insightful This is especially true of *The Descent of Man and Selection in Relation to Sex* Darwin's second most important work This edition is a facsimile reprint of the first printing of the first edition 1871 not previously available in paperback The work is divided into two parts Part One marshals behavioral and morphological evidence to argue that humans evolved from other animals Darwin shows that human mental and emotional capacities far from making human beings unique are evidence of an animal origin and evolutionary development Part Two is an extended discussion of the differences between the sexes of many species and how they arose as a result of selection Here Darwin lays the foundation for much contemporary research by arguing that many characteristics of animals have evolved not in response to the selective pressures exerted by their physical and biological environment but rather to confer an advantage in sexual competition These two themes are drawn together in two final chapters on the role of

sexual selection in humans In their Introduction Professors Bonner and May discuss the place of *The Descent* in its own time and relation to current work in biology and other disciplines

The Descent of Man, and Selection in Relation to Sex Charles Darwin, 2004-06 In the discussion on Sexual Selection in my *Descent of Man* no case interested and perplexed me so much as the brightly coloured hinder ends and adjoining parts of certain monkeys As these parts are more brightly coloured in one sex than the other and as they become more brilliant during the season of love I concluded that the colours had been gained as a sexual attraction

On the Origin of Species Charles Darwin, Murat Ukray, 2014-09-14 *On the Origin of Species* published on 24 November 1859 is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology Its full title was *On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life* For the sixth edition of 1872 the short title was changed to *The Origin of Species* Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research correspondence and experimentation Various evolutionary ideas had already been proposed to explain new findings in biology There was growing support for such ideas among dissident anatomists and the general public but during the first half of the 19th century the English scientific establishment was closely tied to the Church of England while science was part of natural theology Ideas about the transmutation of species were controversial as they conflicted with the beliefs that species were unchanging parts of a designed hierarchy and that humans were unique unrelated to other animals The political and theological implications were intensely debated but transmutation was not accepted by the scientific mainstream The book was written for non specialist readers and attracted widespread interest upon its publication As Darwin was an eminent scientist his findings were taken seriously and the evidence he presented generated scientific philosophical and religious discussion The debate over the book contributed to the campaign by T H Huxley and his fellow members of the X Club to secularise science by promoting scientific naturalism Within two decades there was widespread scientific agreement that evolution with a branching pattern of common descent had occurred but scientists were slow to give natural selection the significance that Darwin thought appropriate During the eclipse of Darwinism from the 1880s to the 1930s various other mechanisms of evolution were given more credit With the development of the modern evolutionary synthesis in the 1930s and 1940s Darwin's concept of evolutionary adaptation through natural selection became central to modern evolutionary theory and it has now become the unifying concept of the life sciences

Summary of Darwin's theory Darwin's theory of evolution is based on key facts and the inferences drawn from them which biologist Ernst Mayr summarised as follows Every

species is fertile enough that if all offspring survived to reproduce the population would grow fast. Despite periodic fluctuations, populations remain roughly the same size. Resources such as food are limited and are relatively stable over time. A struggle for survival ensues. Individuals in a population vary significantly from one another. Much of this variation is inheritable. Individuals less suited to the environment are less likely to survive and less likely to reproduce. Individuals more suited to the environment are more likely to survive and more likely to reproduce and leave their inheritable traits to future generations, which produces the process of natural selection. This slowly effected process results in populations changing to adapt to their environments and ultimately these variations accumulate over time to form new species.

The Origin of Species Charles Darwin, Since its publication in 1859 *The Origin of Species* has been the focal point of debate. Darwin's analysis of flora and fauna calls into question the long held concepts of spontaneous generation, divine creation and the unrelatedness of many species. Instead he argues for Natural Selection: species survive and evolve in response to environmental conditions and other circumstances through a process in which those creatures and plants with stronger, more enduring characteristics live to beget more adaptable offspring. It was Darwin's research aboard the H.M.S. Beagle that led to the clash of intellectual titans: religion and science over the true nature of humankind. Here is the book that started one of the greatest debates of the Western world.

The Descent of Man Charles Darwin, Dragan Nikolic, 2014-11-16. Darwin wrote of the fiery ordeal through which this book has passed. He had avoided the logical outcome of the general theory of evolution: bringing man into the scheme. For twelve years and in fact it had by that time been so much accepted that the clamor of the opposition was not strident. He had also been preceded in 1863 by Huxley's *Man's place in nature*. In this book, word evolution occurs for the first time in any of Darwin's works. The last chapter is about sexual selection in relation to man and it ends with the famous peroration about man's lowly origin, the wording of which differs slightly in the first edition from that which is usually quoted. In a letter dated March 28, 1871, Emma Darwin Vol II pp 202-203 mentions the help that his daughter Henrietta Emma had given him in reading the manuscript and correcting the style and calls her my very dear coadjutor and fellow labourer.

The Descent of Man and Selection in Relation to Sex, Charles Darwin, 1871. The nature of the following work will be best understood by a brief account of how it came to be written. During many years I collected notes on the origin or descent of man without any intention of publishing on the subject but rather with the determination not to publish as I thought that I should thus only add to the prejudices against my views. It seemed to me sufficient to indicate in the first edition of my *Origin of Species* that by this work light would be thrown on the origin of man and his history and this implies that man must be included with other organic beings in

any general conclusion respecting his manner of appearance on this earth Now the case wears a wholly different aspect When a naturalist like Carl Vogt ventures to say in his address as President of the National Institution of Geneva 1869 *personne en Europe au moins n ose plus soutenir la cr ation ind pendante et de toutes pi ces des esp ces* it is manifest that at least a large number of naturalists must admit that species are the modified descendants of other species and this especially holds good with the younger and rising naturalists The greater number accept the agency of natural selection though some urge whether with justice the future must decide that I have greatly overrated its importance Of the older and honoured chiefs in natural science many unfortunately are still opposed to evolution in every form

Charles Darwin s *Origin of Species* publ 1859 is a pivotal work in scientific literature and arguably the pivotal work in evolutionary biology The book s full title is *On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life* It introduced the theory that populations evolve over the course of generations through a process of natural selection It was controversial because it contradicted religious beliefs which underlay the then current theories of biology Darwin s book was the culmination of evidence he had accumulated on the voyage of the *Beagle* in the 1830s and added to through continuing investigations and experiments since his return
