Origin of Anti-Tumor Immunity Failure in Mammals Ivan Bubanovic,2007-05-08 The history of science has shown the majority of hypotheses to be wrong Sharp scientific criticism and strictly controlled experimental studies reject most of the hypotheses leaving behind only a small number of assumptions and ideas Nevertheless each logical assumption should have its rightful place on the scientific battlefield supposed to assess its validity and determine its final fate Even when a hypothesis is wrong it still finds its place in the entire efforts of the humankind towards attaining the scientific truth Namely the wrong hypotheses serve largely to illuminate the way towards the correct ones or at least to show which way not to follow Correct or not ideas and hypotheses are necessary for the progress of science They epitomize the efforts of human thought to elucidate nature without experimental verification and in the circumstances of scant data availability Finally hypotheses and ideas represent a symbiotic creation of our knowledge and imagination the two most impressive appearances in the evolution of humans

Autoimmuno-Anti-Tumour Immunity (AATI) - Understanding the Immune Responses against "Self" & "Altered-self" Fang-Ping Huang,2017-05-16 The brief description of tumours being wounds that do not heal by Dr Harold F Dworak nearly three decades ago N Engl J Med 1986 has provided not only a vivid illustration of neoplastic diseases in general but also in retrospect conceptually a plausible immunological definition of cancers Based on our current understanding in the field it could have even a multi dimensional meaning attached with This relates to several important issues which need to be addressed further i e in terms of a close link between chronic inflammation and tumourigenesis widely observed clinical and experimental evidence of immunity against tumours versus the highly immunosuppressive tumour microenvironment being associated and their underlying immunological mechanisms oncogenic basis as well as the true causal relationship in question Recent findings from studies into the pathogenesis of autoimmunity and more importantly the mechanisms which protect against it have offered some new insights for our understanding in this direction Chronic or persistent autoimmune like inflammatory conditions are evidently associated with

tumor development The important question is about their true causal relationship Chronic or persistent inflammation has been shown to contribute directly to tumour development by triggering neoplastic transformation and production of inflammatory mediators which could promote cancer cell survival proliferation and invasion On the other hand tumours are mutated self tissue cells to which the host immune system is largely tolerized otherwise Although the mutations may give rise to the expression of tumour specific antigens TSA or tumour associated antigens TAA most of these TSAs TAAs are found to be poor immunogens The ongoing inflammatory conditions may therefore reflect a desperate attempt of the host immune system to mount anti tumour responses though ineffectively being a consequence of the continuous yet largely futile triggering by those poorly immunogenic TSAs TAAs Furthermore during autoimmune or overtly persistent immunological responses many regulatory mechanisms are triggered in the host in attempts to limit the ongoing harmful inflammatory reactions Such a negative feedback regulation is known to be crucial in preventing normal individuals from immune mediated diseases As a result of the negative feedback loop however an excessive production of anti inflammatory or immunosuppressive molecules followed by the exhaustion of the immune effector cells may instead lower the ability of the host immune system to mount specific anti tumor responses allowing the escape of tumour or mutated cells from immunosurveillance This may also help to explain why the most effective way to enhance host immunity against cancer is by targeting the negative arm of immune regulation In this Frontiers Research Topic we aim to gather current views from experts in these inherent overlapping fields of oncology autoimmunity and tumour immunology and to make them available to our potential readership who may be particularly interested in this cutting edge area By understanding how the immune system is normally regulated why dysregulation of which may cause the immunological oncological related diseases we also encourage further discussions as to how the so called self reactivity autoimmune responses can be alternatively switched on and redirected immunologically or molecularly for effective cancer treatment

Koprowski, O. Maaløe, R. Rott, H. G. Schweiger, M. Sela, L. Syru?ek, P. K. Vogt, 2012-12-06 Expression of an immune response is the net result of complex synergistic and antagonistic activities performed by a variety of cell types It includes macrophages T and B populations which may interact in performance of a response and suppressor cells interfering with it Accordingly a lack of response may not necessarily indicate absence of immunocompetent cells but rather nonexpression of competence Thus one should consider two possible situations which are by no means mutually exclusive to account for immunologic unresponsiveness a one or more of the cell populations composing the synergistic unit is absent or immature and b an antagonistic unit which interferes with the response is dominating In view of this an approach to development of immune reactivity necessitates parallel surveys of development of cells with the potential to perform as well as of cells which can suppress the response Classification of the various cell types

has been based so far on their phenotypic properties e g membrane antigen markers cell receptors pro duction and secretion of immunoglobulins etc Genotypically T and B cells may represent either separate independent cell lines or different stages of development within the same cell lineage Index Medicus ,2003 Vols for 1963 include as pt 2 of the Jan issue Medical subject headings
