SI Heterojunction Bipolar Transistors Mouhsine Fjer,2011 This dissertation addresses the world's first demonstration of strained Si Heterojunction Bipolar Transistors sSi HBTs The conventional SiGe Heterojunction Bipolar Transistor SiGe HBT which was introduced as a commercial product in 1999 after its first demonstration in 1988 has become an established device for high speed applications This is due to its excellent RF performance and compatibility with CMOS processing It has enabled silicon based technology to penetrate the rapidly growing market for wide bandwidth and wireless telecommunications once reserved for more expensive III V technologies SiGe HBTs is realised by the pseudomorphic growth of SiGe on a Si substrate which allows engineering of the base region to improve performance In this way the base has a smaller energy band gap than the emitter which increases the gain The energy band gap of SiGe reduces with increasing Ge composition but the maximum Ge composition is limited by the amount of strain that can be accommodated within a given base layer thickness Therefore a new innovation is necessary to overcome this limitation and meet the continuous demand for high speed devices Growing the SiGe base layer over a relaxed SiGe layer Strain Relaxed Buffer can increase the amount of Ge that can be incorporated in the base hence increasing the device performance In this thesis experimental data is presented to demonstrate the realisation of sSi HBTs The performance of this novel device has been also investigated and explained using TCAD tool [Operation of Silicon-germanium Heterojunction Bipolar Transistors](#) on Marco Bellini,2009 Recently several SiGe HBT devices fabricated on CMOS compatible silicon on insulator SOI substrates SiGe HBTs on SOI have been demonstrated combining the well known SiGe HBT performance with the advantages of SOI substrates These new devices are especially interesting in the context of extreme environments highly challenging surroundings that lie outside commercial and even military electronics specifications However fabricating HBTs on SOI substrates instead of traditional silicon bulk substrates requires extensive modifications to the structure of the transistors and results in significant trade offs The present work investigates with measurements and TCAD simulations the performance and reliability of SiGe heterojunction bipolar transistors fabricated on silicon on insulator substrates with respect to operation in extreme environments such as at extremely low or extremely high temperatures or in the presence of radiation both in terms of total ionizing dose and single effect upset [High Frequency Characterization and Modeling of SiGe Heterojunction Bipolar Transistors](#) B. BiCMOS technology is the obvious groundbreaker of the Si heterostructures application space To date virtually every major
player in the communications electronics market either has SiGe up and running in house or is using someone else's SiGe fab
as foundry for their designers Key to this success lies in successful integration of the SiGe HBT and Si CMOS with no loss of
performance from either device Filled with contributions from leading experts Fabrication of SiGe HBT BiCMOS

suit for high speed electronics Since the fabrication costs per design cycle are rapidly increasing with progressing frequency and complexity of the systems accurate compact models are essential in order to enable robust circuit design This thesis focuses on selected important physical effects in advanced SiGe HBTs which have been either insufficiently modeled or completely missing in conventional compact models New compact model equations for the transfer current were derived and successfully applied to a large set of different technologies Hereby the Generalized Integral Charge Control Relation was used as a foundation A physics based model utilizing small signal parameters obtained from measurements is derived for modeling the current dependent collector charge A brief chapter about substrate effects in bipolar transistors comprises the derivation of a compact model for the bias dependent substrate resistance as well as a proper partitioning of the substrate capacitance New extraction methods for compact model parameters are introduced and the application of existing methods to advanced processes is discussed The derived joint extraction method for the emitter and thermal resistance as well as a scalable model for the transfer current have been successfully applied to experimental data of fast HBTs The derived model equations were applied to a selected very advanced SiGe HBT process developed by IHP Highly accurate models for DC and small signal as well as for large signal characteristics are presented
