1. Microwave and Radar Week (MRW 2020)

The 9th Microwave and Radar Week (MRW 2020) was held in Warsaw the capital of Poland, on 5–7 October 2020. Initially, MRW 2020 was to be held in Lithuania, Vilnius, on 18–21 May 2020, but due to the COVID19 pandemic, it was decided to move it to Warsaw, Poland and shift dates to October (Figure 1). Due to the pandemic, for the first time in its history, MRW2020 was organised in a hybrid way—a part of the guests, mainly from Poland, were participating physically, while the majority of foreign guests were taking part virtually via electronic communication means. All presentations, including posters, were available on-line during MRW 2020 and a few weeks after the conference.

The 9th Microwave and Radar Week (MRW 2020) was a continuation of the very successful series of scientific events held previously in Warsaw (2004), Krakow (2006), Wrocław (2008), Vilnius (2010), Warsaw (2012), Gdansk (2014), Krakow (2016) and Poznan (2018). This time MRW 2020 consisted of four conferences: the 23rd International Microwave and Radar Conference (MIKON 2020), the 21st International Radar Symposium (IRS 2020), the Baltic URSI Symposium (Baltic URSI 2020) and the Signal Processing Workshop (SPW 2020). MRW 2020 was an opportunity to present the latest research results and exchange the newest scientific and engineering ideas related to radio, microwave and terahertz frequency devices, systems and techniques, radars, communications, electromagnetics, signal processing, as well as remote sensing.

The total number of MRW 2020 participants was 317 (118 on-site and 199 on-line), representing over 30 countries around the world. A total of 261 papers were presented

The public's serious concern about the uncertainties and dangers of the consequences of human activities on environmental quality demands policies to control the situation and to prevent its deterioration. But far-reaching decisions on the environmental policy are impaired or even made impossible as long as the relevant ecological relations are not sufficiently understood and large scale quantitative information on the most important parameters is not available in sufficient quality and quantity. The techniques of remote sensing offer new ways of procuring data on natural phenomena with three main advantages: the large distance between sensor and object prevents interference with the environmental conditions to be measured; the potentiality for large scale and even global surveys yields a new dimension for the investigations of the environmental parameters; the extremely wide spectral range covered by the whole diversity of sensors discloses many properties of the environmental media not detectable within a single wave band as e.g. the visible. These significant additions to the conventional methods of environmental studies and the particular qualification of several remote sensing methods for quantitative determination of the natural parameters makes this new investigation technique an important tool both to the scientists studying the ecological relationship and the administration in charge of the environmental planning and protection.
