The Oxford Handbook of Food Fermentations Charles W. Bamforth, Robert Edwin Ward, 2014 Fermentation as a chemical and biological process is everywhere. Countless societies throughout history have used it to form a vast array of foods and drinks, many of which were integral and essential to those cultures. It could be argued that the production of beer and bread formed the basis of many agriculture-based civilizations. Today, nearly every person on the planet consumes fermented products, from beer and wine to bread and dairy products to certain types of meat and fish. Fermentation is a nearly ubiquitous process in today's food science and an aspect of chemistry truly worth understanding more fully. In *The Oxford Handbook of Food Fermentations*, Charles W. Bamforth and Robert E. Ward have collected and edited contributions from many of the world's experts on food fermentation, each focused on a different fermentation product. The volume contains authoritative accounts on fermented beverages, distilled beverages, and a diverse set of foods, as well as chapters on relevant biotechnology. Each chapter embraces the nature of the product, its production, and its final composition. The text also touches on the raw materials and processes involved in producing packaged foodstuff and the likely future trends in each area. In the conclusion, Bamforth and Ward present a comparison between the various products and the diverse technologies employed to produce them. Fermentation is a multifaceted process that affects a wide variety of products we consume, and *The Oxford Handbook of Food Fermentations* is the definitive resource that captures the science behind fermentation as well as its diverse applications.

Long and Deep Tunnels Vittorio Guglielmetti, Shulin Xu, Gianni Alberto Arrigoni, Piergiorgio Grasso, 2016-04-15 The design and construction of long and deep tunnels, i.e. tunnels under mountains characterised by either considerable length and/or overburden, represent a considerable challenge. The scope of this book is not to instruct how to design and construct such tunnels, but to share a method to identify the potential hazards related to the process of designing and constructing long and deep tunnels, to produce a relevant comprehensive analysis and listing, to quantify the probability and consequences, and to design proper mitigation measures and countermeasures. The design developed using probabilistic methods is verified during execution by means of the so-called Plan for Advance of the Tunnel (PAT) method, which allows adapting the design and control parameters of the future stretches of the tunnel to the results of the stretches already finished, using the monitoring data base. Numerous criteria are given to identify the key parameters necessary for the PAT procedure. Best practices of excavation management with the help of real-time monitoring and control are also provided. Furthermore, cost and time evaluation systems are analysed. Finally, contractual aspects related to construction by contract are investigated for best development and application of models more appropriate for tunnelling construction contracts. The work will be of interest to practising engineers, designers, consultants, and students in mining, underground tunnelling, transportation, and construction engineering, as well as to foundation and geological engineers, urban planners, developers, and architects.
