Information Technology for Balanced Manufacturing Systems Weiming Shen, 2007-03-07 The manufacturing sector has been facing major challenges as it undergoes revolutionary changes fuelled by new and sophisticated demands from customers global competition distribution of manufacturing and marketing activities and technological advances In order to address these challenges manufacturing enterprises need to change the way they do business and adopt innovative

technologies and solutions to increase their responsiveness and production efficiency Information technology plays an essential role in this process Current manufacturing systems are collections of complex systems or subsystems operating in distributed collaborative environments involving software hardware humans and organizations It is crucial to keep a balance between the technical aspects of automation and the human and social facets when applying information technology in industrial applications particularly with the rapid advancements in information and communication technologies and the wide deployment of automated manufacturing systems However in order to create appropriate frameworks for exploring the best synergies between humans and automated systems there are still numerous issues in terms of processes characterization modeling and development of adequate support tools BASYS conferences have been developed and organized to promote the development of balanced automation systems in an attempt to address these issues The first BASYS conference was successfully launched in Victoria Brazil 1995 and then the following conferences were held in Lisbon Portugal 1996 Prague Czech Republic 1998 Berlin Germany 2000 Cancun Mexico 2002 and Vienna Austria 2004

Statistical Signal Processing of Complex-Valued Data Peter J. Schreier, Louis L. Scharf, 2010-02-04 Complex valued random signals are embedded in the very fabric of science and engineering yet the usual assumptions made about their statistical behavior are often a poor representation of the underlying physics This book deals with improper and noncircular complex signals which do not conform to classical assumptions and it demonstrates how correct treatment of these signals can have significant payoffs The book begins with detailed coverage of the fundamental theory and presents a variety of tools and algorithms for dealing with improper and noncircular signals It provides a comprehensive account of the main applications covering detection estimation and signal analysis of stationary nonstationary and cyclostationary processes Providing a systematic development from the origin of complex signals to their probabilistic description makes the theory accessible to newcomers This book is ideal for graduate students and researchers working with complex data in a range of research areas from
