Measurement Of Free Calcium In Cells:

The Ca²⁺ Pump of Plasma Membranes Alcides F. Rega, 2018-02-06 This title was first published in 1986 It comprises contemporary knowledge of the calcium pump of plasma membranes and associated fields of research **New Techniques of Optical Microscopy and Microspectroscopy** Cherry, 1991 The last few years have seen an upsurge of interest in the study of cells by optical microscopy The advent of new techniques such as confocal microscopy and the availability of extremely sensitive digital imaging devices are revolutionizing the field A number of groups have developed new ways of making spectroscopic measurements at the microscopic level accompanied by the introduction of appropriate sensor molecules for cellular assays The aim of this volume will be to bring together the various advances in order to provide the reader with an up to date account of what can now be achieved with modern optical microscopic methods *Mechanisms of Stimulus—Response Coupling in Platelets* J. Westwick, M. F. Scully, D. E. MacIntyre, V. V. Kakkar, 2013-03-09 Since its inception the research area of platelet pharmacology has always been a vigorous one and it is a characteristic that new approaches to the understanding of platelet function are rapidly and thoroughly investigated The intensity of this activity is attributable probably to an appreciation by research workers in the field that a satisfactory therapeutic control of platelet function has yet to be realized Also that if and when this problem of controlling platelet function is achieved the benefits to clinical medicine will be immense since platelets are known to be involved in a multiplicity of events coupled within the haemostatic mechanisms and inflammatory responses Aberrations in the behaviour of platelets is part of the aetiology of atherosclerosis myocardial and cerebral infarction and thrombosis At this point in time research in platelet function is in a particularly rapid state of flux The recent findings of research workers active in the field and also workers investigating mechanisms of stimulus response coupling in other cells have provided interesting insights into the generality of mechanisms involved in the function of responsive cells One may itemize these developments as the area of cell receptor ligand interaction induction of cellular response by protein phosphorylation and calcium flux The mechanism of these latter events occurs through the activity of phospholipase generating transient intermediates These intermediates may act as ionophores or enzyme activators or may in the case of eicosanoids reinforce and make irreversible the cellular response

Applications of Microinjection, Microscopic Imaging, and Fluorescence Peter H. Bach, C.H. Reynolds, J.M. Clark, J. Mottley, P.L. Poole, 2012-12-06 Individual cells behave in surprising ways that cannot be deduced from the averaged results of an organ as assessed by the use of conventional biochemical methods. Thus multicellular plant and animal systems are being investigated by an increasing array of histochemical and cytochemical techniques based on general chemical or specific immunological interactions to identify structural materials and to assess biological activities. In recent years there has been an increasing range of fluorescent probes along with advanced computerised imaging and analysis techniques which allows the behaviour of individual living cells to be followed in considerable detail. The parallel use of microinjection, microelectrodes and patch clamping provides additional information about cells and their responses. Recombinant DNA technology has highlighted the desirability and the power of microinjecting defined materials into specific cells and so manipulating their fundamental biochemistry. New hypotheses are being tested which will form the cornerstone of future developments across the whole spectrum of biotechnology. The First European Workshop on Biotechnology Applications of Microinjection, Microscopic Imaging and Fluorescence was run at the University of East London, U.K. 21st-24th April 1992 with the objective of bringing together a diverse group of individuals who were using these state-of-the-art applications for biotechnological exploration. A novel feature of the meeting was participation by instrument manufacturers in the programme; there were hands-on workshops where living cells could be examined combined with the poster sessions. Cumulated Index Medicus, 1994. Methods in Plant Cell Biology David W. Galbraith, Hans J. Bohnert, Don P. Bourque, 1995. Methods in Plant Cell Biology provides in two volumes a comprehensive collection of analytical methods essential for researchers and students in the plant sciences. Individual chapters written by experts in the field provide an introductory overview followed by a step-by-step technical description of the methods. **Key Features** Written by experts many of whom have developed the individual methods described. Contains most if not all the methods needed for modern research in plant cell biology. Up-to-date and comprehensive. Full references. Allows quick access to relevant journal articles and to the sources of chemicals required for the procedures. Selective concentration on higher plant methods allows for particular emphasis on those problems specific to plants. **Angiotensin Protocols** Donna H. Wang, 2008-02-01 A qualitative leap in the understanding of cardiovascular and renal regulation by the renin-angiotensin system and of the role of this system in tissue damage has occurred as a result of the many recent advances in molecular genetic techniques. The cloning of the genes for the components of the renin-angiotensin system, the design of specific angiotensin receptor ligands and the use of embryonic gene targeting techniques for the creation of mutant strains have established that the renin-angiotensin system is important in blood pressure regulation, ion and fluid homeostasis and tissue growth and remodeling. Further investigation of the mechanisms by which this system participates in cardiovascular regulation may shed some light on the pathogenesis of several cardiovascular diseases e.g. hypertension, congestive heart failure and chronic renal failure. Despite the promise of this system as a target for therapeutic interventions

for these diseases there are great challenges in the integration of the attempts to close the gap between the traditional literature of medicine and the explosion of information from the new technologies This book s title Angiotensin Protocols reflects the authors strong efforts to translate expert knowledge into easy to follow practice The book opens with introductory chapters and each specialty section provides detailed methods covering a wide variety of techniques ranging from genetic manipulation of targeted genes to functional studies of the renin angiotensin system

Cell Imaging Techniques Douglas J. Taatjes,Brooke T. Mossman,2008-02-04 A diverse collection of state of the art methods for the microscopic imaging of cells and molecules The authors cover a wide spectrum of complimentary techniques including such methods as fluorescence microscopy electron microscopy atomic force microscopy and laser scanning cytometry Additional readily reproducible protocols on confocal scanning laser microscopy quantitative computer assisted image analysis laser capture microdissection microarray image scanning near field scanning optical microscopy and reflection contrast microscopy round out this eclectic collection of cutting edge imaging techniques now available The authors also discuss preparative methods for particles and cells by transmission electron microscopy
