microbiomes has garnered significant attention due to its potential to address global food insecurity particularly in low and middle income countries As the global population continues to grow improving crop yield and productivity through advanced breeding programs has become imperative Plants and their associated microbial communities have co evolved over millennia forming intricate relationships that significantly impact plant health and fitness Recent studies have highlighted the benefits of these microbial communities such as enhanced growth improved nutrient uptake and increased tolerance to environmental stresses Despite these advancements traditional methods of analyzing multi omics data such as meta genomics meta transcriptomics and meta proteomics are often inadequate These methods struggle with false positives and fail to capture the interaction effects between variables leaving gaps in our understanding of how microbiomes influence plant phenotypes The advent of machine learning ML algorithms has revolutionized this field offering new ways to analyze complex microbiome data and predict their impact on plant traits [Proceedings of IPSC 2019 - 2nd International Plant Spectroscopy Conference](#)

Morphological Plant Modeling: Unleashing Geometric and Topological Potential within the Plant Sciences

Alexander Bucksch,Dan Chitwood,2017-10-13 An increasing population faces the growing demand for agricultural products and accurate global climate models that account for individual plant morphologies to predict favorable human habitat Both demands are rooted in an improved understanding of the mechanistic origins of plant development Such understanding requires geometric and topological descriptors to characterize the phenotype of plants and its link to genotypes However the current plant phenotyping framework relies on simple length and diameter measurements which fail to capture the exquisite architecture of plants

The Research Topic Morphological Plant Modeling Unleashing Geometric and Topological Potential within the Plant Sciences is the result of a workshop held at National Institute for Mathematical and Biological Synthesis NIMBioS in Knoxville Tennessee From 2 4 September 2015 over 40 scientists from mathematics computer science engineering physics and biology came together to set new frontiers in combining plant phenotyping with recent results from

shape theory at the interface of geometry and topology In doing so the Research Topic synthesizes the views from multiple disciplines to reveal the potential of new mathematical concepts to analyze and quantify the relationship between morphological plant features As such the Research Topic bundles examples of new mathematical techniques including persistent homology graph theory and shape statistics to tackle questions in crop breeding developmental biology and vegetation modeling The challenge to model plant morphology under field conditions is a central theme of the included papers to address the problems of climate change and food security that require the integration of plant biology and mathematics from geometry and topology research applied to imaging and simulation techniques The introductory white paper written by the workshop participants identifies future directions in research education and policy making to integrate biological and mathematical approaches and to strengthen research at the interface of both disciplines *The Computerized Greenhouse* Bozzano G Luisa,2012-12-02 The aim of this book is to open up research areas in automatic control engineering for crop production systems in horticulture and agriculture and to explain the principle ideas of advanced automatic control in plant production The text includes detailed discussions of Fundamental systems engineering concepts Modeling Control for agricultural systems Optimal control and its applications Artificial intelligence for agricultural applications **Genetic Engineering of Osmoregulation** D. W. Rains,2012-12-06 The plant world represents a vast renewable resource for production of food chemicals and energy The utilization of this resource is frequently limited by moisture temperature or salt stress The emphasis of this volume is on the molecular basis of osmoregulation adaptation to salt and water stress and applications for plant improvement A unified concept of drought salt thermal and other forms of stress is proposed and discussed in the publication The volume developed from a symposium entitled Genetic Engineering of Osmoregulation Impact on Plant Productivity for Food Chemicals and Energy organized by D W Rains and R C Valentine in cooperation with Brookhaven National Laboratory and directed by D W Rains and A Hollaender The program was supported by a grant from the National Science Foundation Division of Problem Focused Research Problem Analysis Group and the Department of Energy This symposium is one of several in the past and pending which deal with potential applications of genetic engineering in agriculture Since the question was raised several times during the meeting it is perhaps a convenient time to attempt to define genetic engineering in the context of the meeting Genetic engineering of osmoregulation is simply the application of the science of genetics toward osmotically tolerant microbes and plants Recombinant DNA is regarded as just another tool along with conventional genetics to be utilized for improvement of microbes and plants
