

airframe, ground effect, vibration, acoustics and the vortex ring state. The interaction between the rotor aerodynamic forces and the structural behaviour of the aircraft forms the final part of this valuable chapter.

A short appendix is provided giving tables of the leading particulars of modern helicopters and conversion factors between units systems.

The author firmly believes that readers should be familiar with both Imperial and SI units – I agree. Each chapter has a selection of questions and a considerable list of pertinent reference material. The book is a heavyweight both intellectually and in weight.

It should be of much use to all personnel involved with rotorcraft and allied subject areas. I have been involved in helicopters for 37 years but this book will provide me with many hours of reading. There are always many things to learn and I will have my nose in a copy for a long while. Like all text books it is not cheap but it forms a very worthwhile purchase. It is very well printed and the diagrams and images are clear. The overall impression is very good indeed.

## Fracture and Damage of Composites

Edited by M. Guagliano and M.H. Aliabadi

WIT Press, Ashurst Lodge, Ashurst, Southampton, SO40 7AA, UK, 2006. 288pp. Illustrated. £97. ISBN 1-85312-669-1.

This is Volume Eight in a series of publications under the title *Advances in Fracture Mechanics*. Each volume in the series is a compilation of state of the art papers from leading researchers. The current volume, of nine chapters, focuses on fracture and damage in composite materials. Five chapters of the book rely heavily upon on numerical methods, particularly the Boundary Element Method which underpins the last four contributions.

The first chapter compares two methods of estimating the compressive strength of laminated composites. These are a piece-wise homogeneous media model and a continuum theory approach. The accuracy of the continuum approach is investigated for incompressible nonlinear materials undergoing large deformation biaxial compression.

The second chapter presents a micromechanical model of macroscopic crack propagation under stress corrosion cracking. The model is compared with experiment on compact tension specimens made from glass reinforced epoxy composite under constant load,

in a hydrochloric acid environment. Estimates for the times to failure of unidirectional and cross-ply composite laminates are presented.

The damage mechanisms in pultruded composite rods are investigated in the third chapter. Loading is both static and fatigue. Experiments are carried out on an E-glass polyester resin composite, in which the effect of the stress ratio and gripping conditions are investigated.

Experimental examination of fatigue damage in particulate metal matrix composites is presented in chapter 4. The material system is alumina reinforced 6061 aluminium alloy. A parameter, the total strain energy, is shown to correlate well with fatigue life of the composite under multi-axial loading.

The mechanical properties of woven fabric composites are modelled numerically in chapter 5 using the finite element method. A representative volume element is defined and the predicted stiffness response compared with experiment on plain and twill weave carbon-epoxy composites.

The last four chapters all use the Boundary Element Method. In chapter 6 the formulation for the elastic fracture mechanics of anisotropic composites subjected to static and dynamic loading is developed. An incremental crack growth analysis is compared with published results.

Chapter 7 is unique in the sense that it deals with functional rather than structural materials. The Boundary Element Method is developed for a piezoelectric composite with edge delamination. The elasto-electric states are obtained for a Poly Vinylidene Fluoride piezoelectric laminate under a wide range of loading conditions.

Chapter 8 develops the Boundary Element Method to the fracture mechanics of cracks with contact. The approach is applied to 0/90 laminates with delaminations and debonding cracks between the fibre and matrix. This chapter distinguishes itself by having an extensive bibliography of over 150 references.

The last chapter investigates the three-dimensional nature of cracks between bimaterial interfaces. Particular attention is given to the propagation of debonding cracks. Experimental results are presented for unidirectional glass-epoxy composites under transverse loading.

The book generally succeeds in its aim of providing the reader with an up to the moment reference on the most recent developments in the field, together with original research of the authors. As such, it provides a valuable reference to students embarking on research projects in the characterisation of damage in composite materials, particularly if they intend using the Boundary Element Method.

## Highly Flexible Structures: Modeling, Computation and Experimentation

P.F. Pai

American Institute of Aeronautics and Astronautics, 1801 Alexander Bell Drive, Suite 500, Reston, VA 20191-4344, USA. 2007. 742pp + diskette. Illustrated. \$89.95 (AIAA Members). \$129.95 (Non-Members). ISBN 978-1-56347-917-5.

There have been many books on the nonlinear analysis of structures and similar problem areas. The topic has until recently been largely an academic challenge, and most authors have been from the university sector. Unfortunately the emphasis has been on the sophisticated tools now available, many pioneered by applied mathematicians, and the consequent texts have often wallowed in mathematical jargon. Hence most have been ignored by industrial practitioners.

However the emergence of commercial software (such as ABAQUS and DYNA-3D etc.) has led to its use as a design tool, largely because of the power and cheapness of computers but also due to their user-friendliness. This has been aided by their robustness and interfacing with familiar CAD/CAE packages. The danger now is the use of codes in a 'black box' mode where the user may not understand why the structural behaviour does not converge or (even worse) converges to the wrong answer. A book on nonlinear analysis, bereft of jargon, and with many examples, is to be welcomed.

This book largely meets this specification. It is one in the AIAA Educational Series and therefore aims to be a teaching text, each chapter concluding with selected tutorial questions. The theme is specifically 'highly flexible structures' and most of the worked examples fall into this category. Examples are deployable antenna and 'snap-back' control booms for spacecraft (the Explorer satellite apparently had a 460m antenna!), helicopter main blades, high-altitude long-endurance UAVs, cable structures, membrane roofs, light helical springs etc.

There are 759 pages of which the first 227 are (quite rightly) devoted to fundamental structural mechanics, the effect of gross deformations, of material nonlinearities, and the classical range of solution procedures such as Newton-Raphson, modified Riks, Newmark and several explicit strategies, plus the author's favourite variation 'multiple shooting method.'

Preumont, 2006-04-11 My objective in

writing this book was to cross the bridge between the structural dynamics and control communities while providing an overview of the potential of SMART materials for sensing and actuating purposes in active vibration control I wanted to keep it relatively simple and focused on systems which worked This resulted in the following i I restricted the text to fundamental concepts and left aside most advanced ones i.e. robust control whose usefulness had not yet clearly been established for the application at hand ii I promoted the use of collocated actuator sensor pairs whose potential I thought was strongly underestimated by the control community iii I emphasized control laws with guaranteed stability for active damping the wide ranging applications of the IFF are particularly impressive iv I tried to explain why an accurate prediction of the transmission zeros usually called anti resonances by the structural dynamicists is so important in evaluating the performance of a control system v I emphasized the fact that the open loop zeros are more difficult to predict than the poles and that they could be strongly influenced by the model truncation high frequency dynamics or by local effects such as membrane strains in piezoelectric shells especially for nearly collocated distributed actuator sensor pairs this effect alone explains many disappointments in active control systems      Teleoperation and Robotics in Space Carl F.
