

Memory

Memory is fundamental for the execution of daily activities, for it allows us to learn and apprehend. Depending on its function and type, it is related to different areas of the brain.

HOW MEMORY IS TRAINED

One can perfect the process of codification, generating multiple associations with memories and using mnemonic techniques. To remember a number:

MINEMONIC TECHNIQUES

Methods that employ visual images and association of ideas.

WORD PUZZLE METHOD

Wants to remember

1 One learns a list of words that rhyme with the given numbers.

2 One imagines the association between these images and those of the words to be remembered.

3 Then one simply thinks of the number. This will help one recall the word puzzle that is associated with the item one wishes to remember.

In order to convert perceptions into memories, they need to be processed.

IMPLICIT MEMORY

Used in tasks that require practice in order to be incorporated. They do not require a conscious effort to be applied.

EMOTIONAL RESPONSES

They are basic and arise from an external stimulus.

PRIMING

The ability to recognize an object by one of its constituent parts.

EXPLICIT MEMORY

The stored information concerns persons, places and objects. It requires a conscious effort in order to be applied.

IMAGES OF THE BRAIN'S FUNCTIONING

Many techniques of image analysis, like PET (positron emission tomography) and the more recent fMRI (functional magnetic resonance imaging), enable one to observe the parts of the brain that display the highest activity depending on the task being performed.

The codification of information activates the left prefrontal cortex.

When attempting to recall memories, the right prefrontal cortex is activated.

AMNESIA

The loss of memory, be it temporary or permanent, caused by organic or functional factors.

ANTEROGRADE Loss of memory, events or experiences lived through recently.

RETROGRADE The inability to call up in the present memories from the distant past.

PSYCHOGENIC Produced by emotional traumas of great intensity.

Mechanisms Of Memory:

Mechanisms of Memory J. David Sweatt, 2003-11-18 This book stands as the first unified overview of the cellular and molecular mechanisms underlying higher order learning and memory. It integrates modern discoveries concerning learning and memory disorders such as mental retardation syndromes and Alzheimer's Disease while also emphasizing the results gained from the cutting edge research methodologies of genetic engineering, complex behavioral characterization, proteomics, and molecular biology. This book provides a foundation of experimental design that will be useful to all students pursuing an interest in laboratory research. This book is an enlightening and invaluable resource for anyone concerned with memory mechanisms. Presents a unified view of memory mechanisms from behavior to genes and drawing examples from many different brain regions, types of learning, and various animal model systems. Includes numerous practical examples for the new investigator on how to implement a research program in the area of learning and memory. Provides a balanced treatment of the strengths and weaknesses in modern experimental design.

Neuronal Mechanisms of Memory Formation Christian Hölscher, 2000-11-06 Long term potentiation (LTP) is the most dominant model for neuronal changes that might encode memory. LTP is an elegant concept that meets many criteria set up by theoreticians long before the model's discovery and also fits the anatomical data of learning dependent synapse changes. Since the discovery of LTP, the question has remained regarding how closely LTP produced in vitro by artificial stimulation of neurons actually models putative learning induced synaptic changes. A number of recent investigations have tried to correlate synaptic changes observed after learning with changes produced by artificial stimulation of neurons. Some of these studies have failed to find a correlation between the two forms of synaptic plasticity, signalling a need to discuss the concept of LTP and possible alternate processes that could fit the available data. This book presents a selection of ideas that range from supporters of the LTP theory to different novel concepts that have yet to be investigated. This volume will prepare the ground for research in this area in the new millennium.

Mechanisms of Memory J. David Sweatt, 2009-09-28 This fully revised second edition provides the only unified synthesis of available information concerning the mechanisms of higher order memory formation. It spans the range from learning theory to human and animal behavioral learning models to cellular physiology and biochemistry. It is unique in its incorporation of chapters on memory disorders, tying in these clinically important syndromes with the basic science of synaptic plasticity and memory mechanisms. It also covers cutting edge approaches such as the use of genetically engineered animals in studies of memory and memory diseases. Written in an engaging and easily readable style and extensively illustrated with many new full color figures to help explain key concepts, this book demystifies the complexities of memory and deepens the reader's understanding. More than 25% new content, particularly expanding the scope to include new findings in translational research. Unique in its depth of coverage of molecular and cellular mechanisms. Extensive cross referencing to Comprehensive Learning and Memory. Discusses clinically relevant memory disorders in the context of modern

molecular research and includes numerous practical examples

Molecular Mechanisms of Memory Formation Kartik Ramamoorthi, Massachusetts Institute of Technology. Department of Brain and Cognitive Sciences, 2014 A fundamental goal in neuroscience is to understand mechanisms underlying the ability to create memories from sensory experience While large structures such as the hippocampus are known to be critical for certain types of learning memories are ultimately thought to be represented in sparsely distributed neuronal ensembles within these larger structures Currently there are few tools that allow for the identification and manipulation of these ensembles which has limited our understanding of the molecular and cellular processes underlying learning and memory We have previously reported that the activity regulated transcription factor Npas4 is selectively induced in a sparse population of CA3 following contextual fear conditioning Global knockout or selective deletion of Npas4 in CA3 both resulted in impaired contextual memory and restoration of Npas4 in CA3 was sufficient to reverse the deficit in global knockout mice Taking advantage of the critical role of Npas4 in contextual memory formation we developed a set of novel molecular tools to gain access to cell populations activated by experience Using this system we identified and manipulated the properties of neurons activated by behavioral experience in a variety of neural circuits in mice rats and Drosophila We believe that the tools developed in this thesis can provide a major advancement in the field and will allow researchers to target any neural circuit activated by experience in a variety of species
