New Essays In Free Logic In Honour Of Karel Lambert:

New Essays in Free Logic Edgar Morscher, Alexander Hieke, 2001-12-31 Free logic i.e. logic free of existential presuppositions in general and with respect to singular terms in particular began to come into its own as a field of research in the 1950s. As is the case with so many developments in Western philosophy its roots can be traced back to ancient Greek philosophy. It is only during the last fifty years however that it has become well established as a branch of modern logic. The name of Karel Lambert is most closely connected with this development: he gave it its name and its profile as a well defined field of research. After a development of fifty years it is time to look back and take stock while at the same time scanning for new perspectives. This is the purpose of the papers collected in this volume. The first paper is written by Karel Lambert himself who also comments on all the papers of the other authors. In an introductory essay we give a survey of the present status of and new directions in free logic.

New Essays in Free Logic E. Morscher, A. Hieke, 2001-12-31 This volume contains a collection of recent papers on Free Logic which cover a wide range of topics. These topics show that Free Logic is applied not only in traditional philosophical areas but also in various contexts of modern formal logic as well as in the discussion of theoretical aspects of programming. Part I of the book covers theories of names and definite descriptions. Part II contains papers on various topics in the logic of modalities. Part III is devoted to semantics and programming. In part IV Free Logic is used to analyse and discuss topics from the history of philosophy. In addition one of the founders of Free Logic, Karel Lambert, not only contributes an article to this volume but he also comments on the papers of all the other authors. So this book will be of interest not only to philosophers and logicians but also to computer scientists and researchers interested in foundational aspects of computer programming.

Analysis and Synthesis of Logics Walter Carnielli, Marcelo Coniglio, Dov M. Gabbay, Paula Gouveia, Cristina Sernadas, 2008-01-22 Starting with simple examples showing the relevance of cutting and pasting logics, the monograph develops a mathematical theory of combining and decomposing logics ranging from propositional and first order based logics to higher order based logics as well as to non truth functional logics. The theory covers mechanisms for combining semantic structures and deductive systems either of the same or different nature for

instance two Hilbert calculi or a Hilbert calculus and a tableau calculus The important issue of preservation of properties is extensively addressed For instance sufficient conditions are provided for a combined logic to be sound and complete when the original component logics are known to be sound and complete The book brings the reader to the front line of current research in the field by showing both recent achievements and directions of future investigations in particular multiple open problems It also provides examples of potential applications in emergent fields like security protocols quantum computing networks and argumentation theory besides discussing more classical applications like software specification knowledge representation computational linguistics and modular automated reasoning This monograph will be of interest to researchers and graduate students in mathematical logic theory of computation and philosophical logic with no previous knowledge of the subject of combining and decomposing logics but with a working knowledge of first order logic The book will also be relevant for people involved in research projects where logic is used as a tool and the need for working with several logics at the same time is mandatory for instance temporal epistemic and probabilistic logics
