Spain November 25 28 1994 **Immunopharmacology** Manzoor M. Khan,2016-06-21 The concept of immunotherapy was in infancy when the first edition was written since then major advances have been made not only with several prominent clinical trials but also with the approval of cell based therapy by the FDA for the treatment of cancer in 2010 These events resulted in a gradually narrowing gap between early scientific knowledge and the late development of immune based therapies Consequently the significance and magnitude of these advances warranted a revision of this contribution this revised edition will provide a deeper understanding of the recent advances and discoveries related to the function of the immune response and their applications in the development of novel therapies to treat human diseases Some of the key discoveries during the past five years include the identification of the new subsets of helper T cells new cytokines and their networks and novel signal transduction mechanisms For example the identification of TH17 subset of helper T cells in addition to TH1 and TH2 cells not only advanced our understanding of the function of the basic immune response but also raised our awareness of the possible etiology and pathogenesis of diseases such as allergy asthma rheumatoid arthritis and other auto immune immune system based diseases The newly identified powerful cytokine networks that regulate both innate and acquired immune responses emerged as a result of the finding of new cell types such as innate lymphoid cells and iNKT Identification of the novel cytokines and their networks has advanced our knowledge of the mechanisms involved in the maintenance of tissue homeostasis including inflammation and tissue repair during stress and injury The development of HIV vaccines has also seen dramatic changes over the last few years There has been a shift from a sole focus on T cell vaccines to a holistic approach that pertains to the induction of both humoral and cellular elements This entails the induction of antibodies both binding and neutralizing to prevent infection The cellular vaccination produces a safety net of CD8 T cell responses to suppress the replication of the virus in the infected patients and both of the effector arms are aided by helper T cells From the perspective of clinical applications significant advances have also been made in oral immunotherapy for allergic disease the possible treatment of HIV infection the development of new monoclonal antibodies and their fragments to treat human diseases and immune cell based therapies for cancer *Neuroimmune Diseases* Hiroshi Mitoma,Mario Manto,2019-08-13 A translational overview of neuroimmune diseases for neuroscientists and clinicians that clarifies the pathological mechanisms underlying neuroimmune diseases and builds a comprehensive bridge between the latest research findings and their clinical implications in daily practice The material is presented in two steps The first section comprises a review of the pathogenic actions of immune cells in brain diseases Here the authors discuss the mechanisms through which immune cells disrupt the functions of nerve cells The second section explores the ways in which the brain becomes dysfunctional due to impaired nerve cell function Based on pathogenesis diagnostic and therapeutic strategies are discussed for each clinical category The book will be invaluable for use in clinical practice of neuroimmune diseases American Journal of Physiology ,1993 Vols for 1898 1941 1948 56 include the Society s proceedings primarily abstracts of papers

Crosstalk between MicroRNA and Oxidative Stress in Physiology and Pathology Antonella Fioravanti, Francesco Dotta, Antonio Giordano, Luigi Pirtoli, 2020-06-18

MicroRNAs miRNAs are small noncoding RNAs that are 19 24 nucleotides in length following maturation Recent evidence has demonstrated their key role as post transcriptional regulators of gene expression through the binding of specific sequences within target messenger RNA mRNA miRNAs are involved in the synthesis of a very large number of proteins and it is speculated that they could regulate up to 30% of the human genome They control virtually every cellular process and are essential for animal development cell differentiation and homeostasis Altered miRNA expression has been linked to such pathological events as inflammatory degenerative or autoimmune processes and have been associated with several diseases including cancer cardiovascular diseases diabetes mellitus and rheumatic and neurological disorders Recently miRNAs have been found in many different biological fluids and this observation suggests the potential of miRNAs as new candidate biomarkers for diagnosis classification prognosis and responsiveness in the treatment of different pathological conditions Furthermore the development of therapeutic strategies that involve either restoring or repressing miRNAs expression and activity has attracted much attention Significant progress has been made in the systems for delivery of miRNAs even if substantial improvements in this area are still necessary Although they have been extensively studied a number of interesting questions regarding the physiological and pathological role of miRNAs have been postulated and their potential diagnostic and therapeutic role remain yet unanswered Reactive oxygen species ROS are free radical containing oxygen molecules derived from cellular oxidative metabolism including enzyme activities and mitochondrial respiration and play a pivotal role in many cellular functions Whereas ROS are essential for normal cellular processes their aberrant production or failure of the capacity to scavenge excessive ROS induces an altered redox status with excessive synthesis of free radicals leading to an imbalance in the redox environment of the cell The loss of normal ROS levels causes lipid protein and DNA damage which contribute to the development of various pathologies including neurological disorders rheumatic and cardiovascular diseases diabetes and cancer Increasing evidence highlights that there is crosstalk between miRNAs and components of redox signaling even if this complex and the characteristics of mutual interaction need to be amply elucidated Hence both miRNAs and oxidative stress are involved in the multifactorial development and progression of acute and chronic diseases by influencing numerous signaling and metabolic pathways The Special Issue entitled Crosstalk between MicroRNA and Oxidative Stress in Physiology and Pathology of the International Journal of Molecular Sciences includes original articles and reviews that provide new insights into the interaction between miRNAs and oxidative stress under normal and pathological conditions which can assist in the development of new therapeutic strategies Finally I would like to thank all the authors for their excellent contribution I hope this Special Issue will provide readers with updated knowledge about the role of miRNAs and oxidative stress in physiology and pathology
