Molecular Mechanisms of Bacterial Virulence C.I. Kado,J.H. Crosa,2012-12-06 The growing body of information on bacteria pathogenic for humans mammals and plants generated within the past ten years has shown the interesting conservation of newly identified genes that play a direct role in the pathogenic mechanism In addition to these genes there are also genes that confer host specificities and other traits important in pathogenesis on these pathogens In this volume we have organized the subject areas to best fit the concept on the way bacterial pathogens recognize interact and invade the host on the regulation of genes involved in virulence on the genes involved in the elaboration of toxins and other pathogenic components such as iron sequestering proteins and on the mechanisms of circumventing the host defense systems These areas are divided into Sections Section I covers the first step when the pathogen seeks its host and Sections II through VI cover subsequent steps leading to pathogenesis while avoiding host defenses We conclude this work with a chapter summarizing information on examples of virulence mechanisms that are highly conserved

Clinical Approach to Infection in the Compromised Host R. Rubin, 2013-11-11 Infection in the Compromised Host has become a classic chapter in textbooks devoted to infectious diseases and internal medicine The numbers of compromised hosts are increasing in the era of modern medicine because of our expanded capabilities to deal with difficult diseases especially neoplasms As a consequence microbiologic complications related to the intensive care administered to these patients are increasing as well Under these circumstances not only does the underlying illness create conditions favorable for the development of unusual infections but often the therapy contributes to the acquisition of potential pathogens that turn into agents responsible for severe and frequently fatal disease Granulocytopenia and immunosuppression have been the two key factors in predisposing patients with cancer and other serious diseases to severe bacterial infections Colonization by hospital acquired pathogens and breaks in the anatomic barriers as a result of disease or medical intervention have contributed to the high incidence of infectious diseases in these patients Although there is some overlap between the types of infection in granulocytopenic and immunosuppressed hosts each of these clinical entities has distinctive features that justify considering them separately reserving the term immunocompromised hosts only when referring to patients who are predisposed to opportunistic infections For about two decades infections in granulocytopenic patients have attracted the attention of clinicians because they represent a model for the study of antimicrobial drugs in hosts deprived of an essential element of defense against bacterial infection that is an adequate number of normally functioning granulocytes **Adverse**
