Volume XV Urology in Childhood was written in 1956 57 and was the first in the series of the Encyclopedia of Urology to appear This present volume has been constructed as a supplement and the original intention was to deal only with those subjects in which there have been significant advances during the intervening sixteen years As the work has proceeded however it has become evident that there is no aspect of paediatric urology which has not been developed and no topic which has not been illuminated by many contributions to the literature Indeed there has been such a copious flow of publications devoted to children s urinary tract disease that a full review is no longer possible within the compass of a volume of this size the decision as to what should be left out has therefore been a matter of the greatest difficulty The choice has been inevitably arbitrary and many omissions are regretted The attempt has been made however to report the most notable developments of the subject and perhaps the greatest change in the practice of paediatric urology has been the full integration with paediatric nephrology The team approach to infant disease in particular has led to greatly improved results I have been fortunate to have Dr T M

**Urology in Childhood** David Innes Williams, 2013-12-14

This volume is concerned with the clinical aspects of urology in childhood the anatomy physiology and pathology are discussed only where they have a direct bearing upon the clinical problem and for a detailed description of these aspects and of operative technique the reader is referred to other volumes of this series Emphasis is laid upon the disorders peculiar to infants and children so that diseases such as tuberculosis the manifestations of which in the child differ little from those in the adult receive less attention Childhood is deemed to cease with the completion of puberty though illustrations have sometimes been taken from adolescent cases The personal views expressed in this work are based upon experience at The Hospital for Sick Children Great Ormond Street at St Peter s and St Paul s Hospitals and at the Institute of Urology University of London I am deeply indebted to all my colleagues and assistants at these institutions for their help and co operation both in the treatment of cases and in the preparation of this volume I would particularly wish to thank Mr T T TwrSTINGTON HIGGINS for introducing me to the

urology of childhood Drs M BODIAN R C B PUGH and L L R WHITE for their assistance in matters of pathology and for preparing specimens for illustration Dr V W PAYNE for his advice on biochemistry Dr

**Fetal Pulmonary Hypoplasia** Jean-Marc Biard, 2010-04 The human lung is a complex and highly specialized organ with over 40 differentiated cell types. Optimal lung function is determined prenatally and an in utero adverse event may interfere with the delicate lung development process and lead to variable degrees of pulmonary hypoplasia. Fetal lung underdevelopment is a major concern for obstetricians and pediatricians since pulmonary hypoplasia PH may lead to severe respiratory distress immediately after birth and even to neonatal death or potential long term morbidity. During a five year period the author had the opportunity to conduct in experienced teams several studies on different fetal malformations that dealt with multiple aspects in the wide spectrum of PH: gastroschisis GAS, giant omphalocele GO, low obstructive uropathies LUTO and congenital diaphragmatic hernia CDH. The thesis which focuses on four papers published as first author reviews important features of PH for a fetal medicine specialist. Three other publications as co author are presented at the end of the manuscript as additional contributions.
