Telematics and Work J.H. Erik Andriesson, Robert A. Roe, 2013-05-24 This volume is part of a publication series emerging from an international interdisciplinary study group on New Technologies and Work NeTWork NeTWork is sponsored by the Werner Reimers Foundation Bad Homburg Germany and the Maison des Sciences de l Homme Paris The NeTWork study group has set itself the task of intellectually penetrating various problem domains posed by the introduction and spread of new technologies in work settings This problem focus requires interdisciplinary co operation The usual mode of operating is to identify an important problem within the NeTWork scope to attempt to prestructure it and then to invite original contributions from European researchers or research teams actively involved in relevant analytic or developmental work A specific workshop serves to cross fertilize the different approaches and to help to integrate more fully the individual contributions The concept of telematics refers to the integration of computer telecommunication and information technologies It alludes to the opportunities presented by the technical means to communicate and transfer data over large distances by intelligent equipment Teleshopping teleconferencing teleworking and telebanking are but a few examples of a development which influences both public and private environments Both households and workplaces are likely to be thoroughly changed by telematics This publication emphasises the application of telematics in working environments The central questions of the book are How will the present and future development of telematics effect the nature and organization of work and under which conditions will this development be optimal From the various contributions it is clear that telematics is not a single direct cause or determinant of particular changes in work and organization The development and application of telematics depend on decision making of actors at a political scene both outside and inside the work organizations The effects of the use of these applications appear to be co determined by many other factors In fact the technology interacts with political economic and social factors in a complex process that shapes new organizational forms and work relationships

Technological Choices and Material Meanings in Early and Middle Bronze Age Hungary Attila Kreiter, 2007  
 This study assesses patterns in technological choices for key cultural groups in Bronze Age Hungary through macroscopic and petrological analyses of ceramic assemblages with a focus on understudied categories such as storage vessels Technological style results in a characteristic way of making pottery through communication of values and beliefs through the generations If technological difference can be identified and is seen as distinctive to a specific cultural group then it follows that by comparing technological traditions it may be possible to distinguish between the different social dynamics of contemporary societies Similarities allow us to assess the nature of social relations between communities This may call into question how traditional studies have constructed typologically defined cultural groups and provide a less fragmented picture of the Bronze Age of Hungary Thus this research is not a methodological study of provenancing ceramics but tries to answer specific archaeological questions through scientific methods
