Abstract: This paper aims to develop and validate a questionnaire to measure the prioritization of strategies to transitioning towards a circular economy and to compare different countries. We proposed a questionnaire based on a five-level ordinal scale to evaluate the 24 strategies of the circular economy under a set of ten criteria given technical issues, as well as social, environmental and economic dimensions of sustainability. Each strategy was defined and evaluated by the participants on the same scale, who are stakeholders involved in the transition towards a circular economy. The validation was conducted by two main procedures, including semantic validation through 17 experts from five countries and statistical validation by 347 survey respondents from 25 countries. The results show that the questionnaire seems a reliable and valid tool to analyze which circular economy strategies countries, regions and cities prioritize. Few studies have been conducted to validate instruments about the circular economy; they are focused at the micro level (industry). Studies that validate measurement instruments regarding the circular economy at the macro level are lacking. This study is the first one to validate the circular economy instrument at the macro level. It can help researchers and practitioners from public and private sectors from a variety of organizations in proposing actions to enable the transition and create performance indicators.

Keywords: circular economy; strategies; sustainability; transition; validation of an instrument

1. Introduction

The traditional “take, make, use and dispose” model, originated and encouraged by the Industrial Revolution, is environmentally incompatible with today’s reality, since it depends on the availability of a large amount of natural resources [1]. A sustainable future requires a system that balances social, environmental, and economic development [2].

In this context, the circular economy (CE) concept emerges, opposing the traditional economy’s paradigm, by proposing a behavioral change in how people consume, use natural resources, and treat waste as a result of production and integrated chains adaptability [3]. In comparison to the linear economy, Korhonen et al. [4] argued that the CE model

Dirichlet Forms Methods for Poisson Point Measures and Lévy Processes Nicolas Bouleau, Laurent Denis, 2016-01-08 A simplified approach to Malliavin calculus adapted to Poisson random measures is developed and applied in this book Called the lent particle method it is based on perturbation of the position of particles Poisson random measures describe phenomena involving random jumps for instance in mathematical finance or the random distribution of particles as in statistical physics Thanks to the theory of Dirichlet forms the authors develop a mathematical tool for a quite general class of random Poisson measures and significantly simplify computations of Malliavin matrices of Poisson functionals The method gives rise to a new explicit calculus that they illustrate on various examples it consists in adding a particle and then removing it after computing the gradient Using this method one can establish absolute continuity of Poisson functionals such as Levy areas solutions of SDEs driven by Poisson measure and by iteration obtain regularity of laws The authors also give applications to error calculus
