Measurement Of Visual Motion:

The Measurement of Visual Motion Ellen Catherine Hildreth, Shimon Ullman, MASSACHUSETTS INST OF TECH CAMBRIDGE ARTIFICIAL INTELLIGENCE LAB., Massachusetts Institute of Technology. Artificial Intelligence Laboratory, Massachusetts Institute of Technology. Industrial Liaison Program, 1982 The analysis of visual motion divides naturally into two stages the first is the measurement of motion for example the assignment of direction and magnitude of velocity to elements in the image on the basis of the changing intensity pattern the second is the use of motion measurements for example to separate the scene into distinct objects and infer their three dimensional structure In this paper we present a computational study of the measurement of motion Similar to other visual processes the motion of elements is not determined uniquely by information in the changing image additional constraint is required to compute a unique velocity field Given this global ambiguity of motion Local measurements from the changing image such as those provided by directionally selective simple cells in primate visual cortex cannot possibly specify a unique local velocity vector and in fact specify only one component of velocity Computation of the full two dimensional velocity field requires the integration of local motion measurements either over an area or along contours in the image We will examine possible algorithms for computing motion based on a range of additional constraints Finally we will present implications for the biological computation of motion

The Measurement of Visual Motion Ellen Catherine Hildreth, 1984 The organization of movement in the changing image that reaches the eye provides our visual system with a valuable source of information for analyzing the structure of our surroundings This book examines the measurement of this movement and the use of relative movement to locate the boundaries of physical objects in the environment *The Measurement Of Visual Motion* E.C. Hildreth, *Computations underlying the measurement of visual motion* Ellen Catherine Hildreth, Massachusetts Institute of Technology. Artificial Intelligence Laboratory, 1984 [Statistical and Geometrical Approaches to Visual Motion Analysis](#) Daniel Cremers, Bodo Rosenhahn, Alan L. Yuille, Frank R. Schmidt, 2009-07-25 This book constitutes the thoroughly refereed post conference proceedings of the International Dagstuhl Seminar on Statistical and Geometrical Approaches to Visual Motion Analysis held in Dagstuhl Castle Germany in July 2008 The workshop focused on critical aspects of motion analysis including motion segmentation and the modeling of motion patterns The aim was to gather researchers who are experts in the different motion tasks and in the different techniques used also involved were experts in the study of human and primate vision The 15 revised full papers presented were carefully reviewed and selected from or initiated by the lectures given at the workshop The papers are organized in topical sections on optical flow and extensions human motion modeling biological and statistical approaches alternative approaches to motion analysis

Interpretation of Visual Motion Muralidhara Subbarao, 2014-07-10 Interpretation of Visual Motion A Computational Study provides an information processing point of view to the phenomenon of visual motion This book discusses the computational theory formulated for recovering the scene

from monocular visual motion determining the local geometry and rigid body motion of surfaces from spatio temporal parameters of visual motion This compilation also provides a theoretical and computational framework for future research on visual motion both in human vision and machine vision areas Other topics include the computation of image flow from intensity derivatives instantaneous image flow due to rigid motion time and space time derivatives of image flow and estimation of maximum absolute error This publication is recommended for professionals and non specialists intending to acquire knowledge of visual motion

Experiments in the Machine Interpretation of Visual Motion David W. Murray, Bernard F. Buxton, 1990 This book describes experimental advances made in the interpretation of visual motion over the last few years that have moved researchers closer to emulating the way in which we recover information about the surrounding world

Computational Analysis of Visual Motion Amar Mitiche, 2013-06-29 Image motion processing is important to machine vision systems because it can lead to the recovery of 3D structure and motion Author Amar Mitiche offers a comprehensive mathematical treatment of this key subject in visual systems research Mitiche examines the interpretation of point correspondences as well as the interpretation of straight line correspondences and optical flow In addition the author considers interpretation by knowledge based systems and presents the relevant mathematical basis for 3D interpretation

Analog VLSI Circuits for the Perception of Visual Motion Alan A. Stocker, 2006-03-30 Although it is now possible to integrate many millions of transistors on a single chip traditional digital circuit technology is now reaching its limits facing problems of cost and technical efficiency when scaled down to ever smaller feature sizes The analysis of biological neural systems especially for visual processing has allowed engineers to better understand how complex networks can effectively process large amounts of information whilst dealing with difficult computational challenges Analog and parallel processing are key characteristics of biological neural networks Analog VLSI circuits using the same features can therefore be developed to emulate brain style processing Using standard CMOS technology they can be cheaply manufactured permitting efficient industrial and consumer applications in robotics and mobile electronics This book explores the theory design and implementation of analog VLSI circuits inspired by visual motion processing in biological neural networks Using a novel approach pioneered by the author himself Stocker explains in detail the construction of a series of electronic chips providing the reader with a valuable practical insight into the technology Analog VLSI Circuits for the Perception of Visual Motion analyses the computational problems in visual motion perception examines the issue of optimization in analog networks through high level processes such as motion segmentation and selective attention demonstrates network implementation in analog VLSI CMOS technology to provide computationally efficient devices sets out measurements of final hardware implementation illustrates the similarities of the presented circuits with the human visual motion perception system includes an accompanying website with video clips of circuits under real time visual conditions and

additional supplementary material With a complete review of all existing neuromorphic analog VLSI systems for visual motion sensing Analog VLSI Circuits for the Perception of Visual Motion is a unique reference for advanced students in electrical engineering artificial intelligence robotics and computational neuroscience It will also be useful for researchers professionals and electronics engineers working in the field *Dynamics of Visual Motion Processing* Guillaume S. Masson, Uwe J. Ilg, 2009-12-02 Motion processing is an essential piece of the complex brain machinery that allows us to reconstruct the 3D layout of objects in the environment to break camouflage to perform scene segmentation to estimate the ego movement and to control our action Although motion perception and its neural basis have been a topic of intensive research and modeling the last two decades recent experimental evidences have stressed the dynamical aspects of motion integration and segmentation This book presents the most recent approaches that have changed our view of biological motion processing These new experimental evidences call for new models emphasizing the collective dynamics of large population of neurons rather than the properties of separate individual filters Chapters will stress how the dynamics of motion processing can be used as a general approach to understand the brain dynamics itself **Spatial Coherence for Visual Motion Analysis** W. James MacLean, 2006-03-04 This book constitutes the thoroughly refereed post proceedings of the First International Workshop on Spatial Coherence for Visual Motion Analysis 2004 held in May 2004 The eleven revised full research papers presented went through two rounds of reviewing and improvement The papers in this volume cover a wide range in the field of motion analysis that is a central problem in computer vision The workshop examined techniques for integrating spatial coherence constraints during motion analysis of image sequences **Computer Vision--ECCV '92** Giulio Sandini, 1992-04-29 This volume collects the papers accepted for presentation at the Second European Conference on Computer Vision held in Santa Margherita Ligure Italy May 19 22 1992 Sixteen long papers 41 short papers and 48 posters were selected from 308 submissions The contributions are structured into 14 sections reflecting the major research topics in computer vision currently investigated worldwide The sections are entitled features color calibration and matching depth stereo motion tracking active vision binocular heads curved surfaces and objects reconstruction and shape recognition and applications **Readings in Computer Vision** Martin A. Fischler, Oscar Firschein, 2014-06-28 The field of computer vision combines techniques from physics mathematics psychology artificial intelligence and computer science to examine how machines might construct meaningful descriptions of their surrounding environment The editors of this volume prominent researchers and leaders of the SRI International AI Center Perception Group have selected sixty papers most published since 1980 with the viewpoint that computer vision is concerned with solving seven basic problems Reconstructing 3D scenes from 2D images Decomposing images into their component parts Recognizing and assigning labels to scene objects Deducing and describing relations among scene objects Determining the nature of computer architectures that can support the visual function Representing abstractions in the world of computer memory Matching stored descriptions to image representation

Each chapter of this volume addresses one of these problems through an introductory discussion which identifies major ideas and summarizes approaches and through reprints of key research papers Two appendices on crucial assumptions in image interpretation and on parallel architectures for vision applications a glossary of technical terms and a comprehensive bibliography and index complete the volume

High-level Motion Processing Takeo Watanabe,1998 The contributors to

this book focus on such key aspects of motion processing as interaction and integration between locally measured motion units structure from motion heading in an optical flow and second order motion They also discuss the interaction of motion processing with other high level visual functions such as surface representation and attention

Measuring, modelling and minimizing perceived motion incongruence for vehicle

motion simulation

Diane Cleij ,2020-01-28 Humans always wanted to go faster and higher than their own legs could carry them This led them to invent numerous types of vehicles to move fast over land water and air As training how to handle such vehicles and testing new developments can be dangerous and costly vehicle motion simulators were invented Motion based simulators in particular combine visual and physical motion cues to provide occupants with a feeling of being in the real vehicle While visual cues are generally not limited in amplitude physical cues certainly are due to the limited simulator motion space A motion cueing algorithm MCA is used to map the vehicle motions onto the simulator motion space This mapping inherently creates mismatches between the visual and physical motion cues Due to imperfections in the human perceptual system not all visual physical cueing mismatches are perceived However if a mismatch is perceived it can impair the simulation realism and even cause simulator sickness For MCA design a good understanding of when mismatches are perceived and ways to prevent these from occurring are therefore essential In this thesis a data driven approach using continuous subjective measures of the time varying Perceived Motion Incongruence PMI is adopted PMI in this case refers to the effect that perceived mismatches between visual and physical motion cues have on the resulting simulator realism The main goal of this thesis was to develop an MCA independent off line prediction method for time varying PMI during vehicle motion simulation with the aim of improving motion cueing quality To this end a complete roadmap describing how to measure and model PMI and how to apply such models to predict and minimize PMI in motion simulations is presented Results from several human in the loop experiments are used to demonstrate the potential of this novel approach

Ibrahim Sezan,Reginald L. Lagendijk,2012-12-06 An image or video sequence is a series of two dimensional 2 D images sequen tially ordered in time Image sequences can be acquired for instance by video motion picture X ray or acoustic cameras or they can be synthetically gen erated by sequentially ordering 2 D still images as in computer graphics and animation The use of image sequences in areas such as entertainment visual communications multimedia education medicine

surveillance remote control and scientific research is constantly growing as the use of television and video systems are becoming more and more common The boosted interest in digital video for both consumer and professional products along with the availability of fast processors and memory at reasonable costs has been a major driving force behind this growth Before we elaborate on the two major terms that appear in the title of this book namely motion analysis and image sequence processing we like to place them in their proper contexts within the range of possible operations that involve image sequences In this book we choose to classify these operations into three major categories namely i image sequence processing ii image sequence analysis and iii visualization The interrelationship among these three categories is pictorially described in Figure 1 below in the form of an image sequence triangle
