Carnivorous Plants in the Wilderness Makoto

Honda,2014-01-31 This is a book on the ecology of carnivorous plants their lifestyle and surroundings For sample pages please visit www.honda-e.com/ipw.htm Through millions of years of evolution carnivorous plants have acquired special adaptations that may appear quite bizarre and eccentric in the seemingly docile world of the plant kingdom The idea that some plants eat animals sounds so strange that there was strong hesitation on the part of eighteenth century botanists to accept such a notion It is a deviation from our familiar concept of the food chain Plants are eaten by herbivores and herbivores in turn are eaten by carnivores Carnivorous plants have reversed the order of this normal hierarchy that exists within the ecosystem Charles Darwin was one of the first to demonstrate with convincing evidence that some plants had indeed been adapted to the carnivorous habit Modern science has confirmed that the nutrients obtained from captured prey are absorbed through the trap leaf and are carried to the growth points suggesting that the plants do derive benefits The main requirements for the healthy growth of plants are sunlight carbon dioxide water and some inorganic nutrients A deficiency in any of these basic requirements creates a hostile environment for the plants In any adverse situations the plant must adapt to survive Over millions of years the plants struggles for survival have created a staggering array of properties found in the richness of the plant kingdom of our planet today There are places in the world where the soil is poor and plants cannot obtain enough nutrients through the root to sustain their growth This particular environmental stress has given rise to a syndrome quite eccentric in view of the normal plant lifestyle It is in such mineral deficient environments found in some regions of the globe that the plants that have adopted carnivory can be found The Introduction of this book describes carnivorous plants in the world covering various trapping methods deployed by carnivorous plants their beautiful flowers a dilemma associated with pollinators ecology classification and evolution The six chapters that follow describe all the genera of carnivorous plants occurring in North America Pitcher Plants Sarracenia Cobra Plant Darlingtonia Sundews Drosera Venus Flytrap Dionaea Butterworts Pinguicula and Bladderworts Utricularia Each chapter describes in detail a specific trapping mechanism of the genus The Sarracenia chapter describes various color variants of many pitcher plant taxa The Darlingtonia chapter examines a mystery of elusive pollinators of their flowers The Drosera chapter provides thorough coverage of

endemic species *D. filiformis* and *D. linearis* The *Dionaea* chapter explains the most amazing trapping mechanism of the Venus flytrap its clever and deceptive strategies The *Pinguicula* chapter covers all butterwort species occurring in the US together with their lovely flowers The *Utricularia* chapter describes the bladderworts triggering mechanism the world fastest animal trapping action to be found in the plant kingdom The door opening is described using bucking as the key mechanism to release the subtle door lock of the trap The book ends with a 10 page bibliography section All the photographic images presented in this book are critically selected out of thousands of photographs accumulated over many decades Through vivid imagery of nature photography the reader is invited into the wilderness of North America to witness a variety of mysterious carnivorous plant lifestyle in their natural habitats For more visit www.iCarnivorousPlants.com *Killer Carnivorous Plants* Nathan Aaseng, 2018-12-15 Plants sit at the bottom of the food chain They provide meals for the vast majority of animals on earth but what if the food chain were upset Strange as it may sound there are places on virtually every continent where plants are the hunters and animals the hunted Some plants move so quickly that insects do not know what hit them Others lay elaborate traps to lure their prey Featuring stunning full color photographs informative sidebars and accessible text this book will fascinate young readers as it introduces them to real meat eating plants of the world **Venus Flytraps, Bladderworts, and Other Wild and Amazing Plants** Monica Halpern, 2006 Discusses plants that have developed interesting ways to find food and to protect themselves
