

# Mechanical ventilator

Ventilators work by delivering oxygen directly to the lungs. They can also be programmed to pump out carbon dioxide for patients who are unable to exhale on their own.

The patient's heart rate, respiratory rate, and blood pressure are monitored constantly.

Ventilators are set to pump air into the lungs a certain number of times per minute.

Positive air pressure is maintained to help prevent small air sacs (alveoli) in the lungs from collapsing.

oxygen supply

A mixture of air and pure oxygen is pumped through the tube.

The air is warmed and humidified.
