Mechanical Evaluation Strategies For Plastic Materials:

Mechanical Evaluation Strategies for Plastics D R Moore, S Turner, 2001-08-10 This fascinating new book examines strategies for experimental approaches to stiffness strength and toughness testing of plastic and composite materials These materials being non linear viscoelastic impose constraints on testing which are absent from other types of material This book covers the latest testing approaches for providing service pertinent data within a limited budget and relates the structure of the tests and the functions that they serve to the intrinsic nature of the mechanical properties of plastic materials Its aim is also to evaluate beneficial approaches to testing in the context of multiple objectives mechanical evaluation being considered here in the light of modulus measurement and strength ductility measurement Detailed supplements at the end of each chapter expand upon the main points raised The book is aimed at a broad audience of materials scientists and engineers Those in industry will find the accounts of the approaches that can be used for the characterisation of mechanical properties and for utilising mechanical properties effectively in end product applications especially useful Students and lecturers in materials science engineering and polymer science will also find the book invaluable

Weichert, 2023-08-23 This book provides an overview of direct methods such as limit and shakedown analysis which are intended for avoiding cumbersome step by step calculations to determine the limit states of mechanical structures under monotone cyclic or variable actions with unknown loading history The book comprises several contributions that demonstrate how tremendous advances in numerical methods especially in optimization have contributed to the success of direct methods and their applicability to practical engineering problems in structural mechanics and mechanics of materials The contents reflect the outcomes of the workshop Direct Methods for Limit State of Materials and Structures held in Cosenza Italy in June 2022 *Recycling, a Challenge for the Circular Economy* Michel Cathelineau, 2024-11-20 Reducing consumption is now an absolute necessity for the future of our environment The circular economy is designed to reduce resource wastage and waste production but also enables waste recovery leading to the creation of secondary resources All materials regardless of how they have been processed can be reused Recycling a Challenge for the Circular Economy begins its analysis by raising awareness of the role of each of us in reducing the volume of individual waste The book then outlines the strategies and challenges involved in recycling a wide range of materials from minimally processed wood glass building materials or polluted soil to highly processed electrical and electronic waste batteries magnets or plastics Aspects of resource availability are also discussed as well as ways of addressing the dynamic cycle of materials in the context of ever increasing demand

The Finite Element Method in Thermomechanics Tai-Ran Hsu, 2012-12-06 The rapid advances in the nuclear and aerospace technologies in the past two decades compounded with the increasing demands for high performance energy efficient power plant components and engines have made reliable thermal stress analysis a critical factor in the design and operation of such equipment Recently and as experienced by the author the need for sophisticated analyses has been extended to the energy resource industry such as in situ coal gasification and in situ oil recovery from oil sands and shales The analyses in the above applications are of a multidisciplinary nature and some involve the additional complexity of multiphase and phase change phenomena These extremely complicated factors preclude the use of classical methods and numerical techniques such as the finite element method appear to be the most viable alternative solution The development of this technique so far appears to have concentrated in two extremes one being overly concerned with the accuracy of results

and tending to place all effort in the implementation of special purpose element concepts and computational algorithms the other being for commercial purposes with the ability of solving a wide range of engineering problems However to be versatile users require substantial training and experience in order to use these codes effectively Above all no provision for any modification of these codes by users is possible as all these codes are proprietary and access to the code is limited only to the owners
