Mechanics Of Curved Composites:

Mechanics of Curved Composites S.D. Akbarov,A.N. Guz,2012-12-06 This book is the first to focus on mechanical aspects of fibrous and layered composite material with curved structure By mechanical aspects we mean statics vibration stability loss elastic and fracture problems By curved structures we mean that the reinforcing layers or fibres are not straight they have some initial curvature bending or distortion This curvature may occur as a result of design or as a consequence of some technological process During the last two decades we and our students have investigated problems relating to curved composites intensively These investigations have allowed us to study stresses and strains in regions of a composite which are small compared to the curvature wavelength These new accurate techniques were developed in the framework of continuum theories for piecewise homogeneous bodies We use the exact equations of elasticity or viscoelasticity for anisotropic bodies and consider linear and non linear problems in the framework of this continuum theory as well as in the framework of the piecewise homogeneous model For the latter the method of solution of related problems is proposed We have focussed our attention on self balanced stresses which arise from the curvature but have provided sufficient information for the study of other effects We assume that the reader is familiar with the theory of elasticity for anisotropic bodies with partial differential equations and integral transformations and also with the Finite Element Method **Mechanics of Laminated Composite**

Doubly-Curved Shell Structures Francesco Tornabene,Nicholas Fantuzzi,2021-12-01 This manuscript comes from the experience gained over ten years of study and research on shell structures and on the Generalized Differential Quadrature method The title Mechanics of Laminated Composite Doubly Curved Shell Structures illustrates the theme followed in the present volume The present study aims to analyze the static and dynamic behavior of moderately thick shells made of composite materials through the application of the Differential Quadrature DQ technique A particular attention is paid other than fibrous and laminated composites also to Functionally Graded Materials FGMs They are non homogeneous materials characterized by a continuous variation of the mechanical properties through a particular direction The GDQ numerical solution is compared not only with literature results but also with the ones supplied and obtained through the use of different structural codes based on the Finite Element Method FEM Furthermore an advanced version of GDQ method is also presented This methodology is termed Strong Formulation Finite Element Method SFEM because it employs the strong form of the differential system of equations at the master element level and the mapping technique proper of FEM The connectivity between two elements is enforced through compatibility conditions **Mechanics of Composite Materials**

Stability Loss and Buckling Delamination Surkay Akbarov, 2012-08-14 This book investigates stability loss problems of the viscoelastic composite materials and structural members within the framework of the Three Dimensional Linearized Theory of Stability TDLTS The stability loss problems are considered the development of the initial infinitesimal imperfection in the structure of the material or of the structural members This development is studied within the framework of the Three Dimensional Geometrical Non Linear Theory of the Deformable Solid Body Mechanics The solution to the corresponding boundary value problems is presented in the series form in the small parameter which characterizes the degree of the initial imperfection In this way the nonlinear problems for the domains bounded by noncanonical surfaces are reduced for the same nonlinear problem for the corresponding domains bounded by canonical surfaces and the series subsequent linearized problems It is proven that the equations and relations of these linearized problems coincide with the corresponding ones of the well known TDLTS Under concrete investigations as stability loss criterion the case is taken for the initial infinitesimal imperfection that starts to increase indefinitely Moreover it is proven that the critical parameters can be determined by the use of only the zeroth and first approximations IUTAM Symposium on Mechanical Waves for Composite Structures Characterization Dimitrios A. Non-axisymmetric Local Stability Loss of a Hollow Cylinder Surkay D. Akbarov, Zafer Kutug, Muhammad Yousaf Anwar, 2023-12-03 The book presents formulations and examples of three dimensional non axisymmetric stability in viscoelastic anisotropic cylindrical shells The most critical stability loss modes are determined by minimizing the critical loads and critical times with respect to the number of half waves in radial as well as transverse directions Currently there is no literature available on three dimensional local buckling analysis or localized warpage that considers non axisymmetric stability loss in viscoelastic cylindrical shells The contents of this book provide the formulation for such a stability loss analysis through the framework of the three dimensional linearized theory of stability Additionally as this book addresses the problem by modeling the material as a viscoelastic fibrous composite it can be applied to carry out buckling analysis in both elastic and viscoelastic cases Guide to modelling composite viscoelastic shell elements for buckling analysis Provides a framework for defining the failure criterion for viscoelastic materials Course material for teaching shell buckling and viscoelastic composites

Mechanics and Analysis of Composite Materials Valery V. Vasiliev, Evgeny V. Morozov, 2001-02-08

This book is concerned with the topical problems of mechanics of advanced composite materials whose mechanical properties are controlled by high strength and high stiffness continuous fibers embedded in polymeric metal or ceramic matrix Although the idea of combining two or more components to produce materials with controlled properties has been known and used from time immemorial modern composites were only developed several decades ago and have now found intensive application in different fields of engineering particularly in aerospace structures for which high strength to weight and stiffness to weight ratios are required There already exist numerous publications that cover anisotropic elasticity mechanics of composite materials design analysis fabrication and application of composite structures but the difference between this book and the existing ones is that this is of a more specific nature It covers specific features of material behaviour such as nonlinear elasticity plasticity creep and structural nonlinearity and discusses in detail the problems of material micro and macro mechanics that are only slightly touched in existing books e g stress diffusion in a unidirectional material with broken fibers physical and statistical aspects of fiber

strength coupling effects in anisotropic and laminated materials etc The authors are designers of composite structures who were involved in practically all the main Soviet and then Russian projects in composite technology and the permission of the Russian Composite Center Central Institute of Special Machinery CRISM to use in this book the pictures of structures developed and fabricated in CRISM as part of the joint research and design project is much appreciated Mechanics and Analysis of Composite Materials consists of eight chapters progressively covering all structural levels of composite materials from their components through elementary plies and layers to laminates Applied mechanics reviews ,1948
