## **Media Computing:**

**Media Computing** Chitra Dorai, Svetha Venkatesh, 2012-12-06 Traditionally scientific fields have defined boundaries and scientists work on research problems within those boundaries. However, from time to time those boundaries get shifted or blurred to evolve new fields. For instance, the original goal of computer vision was to understand a single image of a scene by identifying objects, their structure, and spatial arrangements. This has been referred to as image understanding. Recently, computer vision has gradually been making the transition away from understanding single images to analyzing image sequences or video understanding. Video understanding deals with understanding of video sequences, e.g., recognition of gestures, activities, facial expressions, etc. The main shift in the classic paradigm has been from the recognition of static objects in the scene to motion-based recognition of actions and events. Video understanding has overlapping research problems with other fields, therefore blurring the fixed boundaries. Computer graphics, image processing, and video databases have obvious overlap with computer vision. The main goal of computer graphics is to generate and animate realistic-looking images and videos. Researchers in computer graphics are increasingly employing techniques from computer vision to generate the synthetic imagery. A good example of this is image-based rendering and modeling techniques in which geometry, appearance, and lighting is derived from real images using computer vision techniques. Here, the shift is from synthesis to analysis, followed by synthesis.

**Mobile Cloud Visual Media Computing** Gang Hua, Xian-Sheng Hua, 2015-11-23 This book explores the internet and mobile ecosystems which are powered by cloud computing, an essential if not indispensable part of our everyday lives. Billions of users worldwide use this technology for information sharing, communication, and social networking, and a high proportion of activity is driven by massive media content such as images, videos, and other emerging 3D visual media. However, managing, searching, and visualizing this gigantic amount of data to facilitate communication is difficult, which has led to an influx of innovation and research in these areas. The research is from academics from all around the world, focusing on the intersection of mobile cloud visual and multimedia computing, and is split into five clear parts. Topics covered in the book include mobile augmented reality, computational photography, mobile visual recognition, and search, and human-computer interaction (HCI). The findings discussed are meant to spur on further creative development in both academia and industry within this area. Mobile Cloud Visual Media Computing would be of great interest to researchers and academics wishing to see how the state of the art in media computing research is applied to innovative applications, whilst engineers and software designers from industry will gain an insight into the key set of technologies which support mobile and cloud media computing.
