*Spaces of Holomorphic Functions in the Unit Ball* Kehe Zhu, 2006-03-22 Can be used as a graduate text Contains many exercises Contains new results **Invariant Potential Theory in the Unit Ball of  $\mathbb{C}^n$**  Manfred Stoll, 1994-05-12 This monograph provides an introduction and a survey of recent results in potential theory with respect to the Laplace Beltrami operator  $D$  in several complex variables with special emphasis on the unit ball in  $\mathbb{C}^n$  Topics covered include Poisson Szeg integrals on the ball the Green's function for  $D$  and the Riesz decomposition theorem for invariant subharmonic functions The extension to the ball of the classical Fatou theorem on non tangible limits of Poisson integrals and Littlewood's theorem on the existence of radial limits of subharmonic functions are covered in detail The monograph also contains recent results on admissible and tangential boundary limits of Green potentials and  $L_p$  inequalities for the invariant gradient of Green potentials Applications of some of the results to  $H_p$  spaces and weighted Bergman and Dirichlet spaces of invariant harmonic functions are included The notes are self contained and should be accessible to anyone with some basic knowledge of several complex variables *Complex Analysis and Potential Theory* Andre Boivin, Javad Mashreghi, 2012 This is the proceedings volume of an international conference entitled Complex Analysis and Potential Theory which was held to honor the important contributions of two influential analysts Kohur N GowriSankaran and Paul M Gauthier in June 2011 at the Centre de Recherches Mathematiques CRM in Montreal More than fifty mathematicians from fifteen countries participated in the conference The twenty four surveys and research articles contained in this book are based on the lectures given by some of the most established specialists in the fields They reflect the wide breadth of research interests of the two honorees from potential theory on trees to approximation on Riemann surfaces from universality to inner and outer functions and the disc algebra from branching processes to harmonic extension and capacities from harmonic mappings and the Harnack principle to integration formulae in  $\mathbb{C}^n$  and the Hartogs phenomenon from fine harmonicity and plurisubharmonic functions to the binomial identity and the Riemann hypothesis and more This volume will be a valuable resource for specialists young researchers and graduate students from both fields complex analysis and potential theory It will foster further cooperation and the exchange of ideas and techniques to find new research perspectives *Ergodic Theory, Groups, and Geometry* Robert J. Zimmer, Dave Witte Morris, 2008-01-01 The study of group actions on manifolds is the meeting ground of a variety of mathematical areas In particular interesting geometric insights can be obtained by applying measure theoretic techniques This book provides an introduction to some of the important methods major developments and open problems in the subject

It is slightly expanded from lectures given by Zimmer at the CBMS conference at the University of Minnesota. The main text presents a perspective on the field as it was at that time. Comments at the end of each chapter provide selected suggestions for further reading including references to recent developments.

**Function Theory in the Unit Ball of  $\mathbb{C}^n$**  W. Rudin, 2012-12-06

Around 1970 an abrupt change occurred in the study of holomorphic functions of several complex variables. Sheaves vanished into the background and attention was focused on integral formulas and on the hard analysis problems that could be attacked with them: boundary behavior, complex tangential phenomena, solutions of the  $\bar{\partial}$  problem with control over growth and smoothness, quantitative theorems about zero varieties, and so on. The present book describes some of these developments in the simple setting of the unit ball of  $\mathbb{C}^n$ . There are several reasons for choosing the ball for our principal stage. The ball is the prototype of two important classes of regions that have been studied in depth: namely the strictly pseudoconvex domains and the bounded symmetric ones. The presence of the second structure, i.e. the existence of a transitive group of automorphisms, makes it possible to develop the basic machinery with a minimum of fuss and bother. The principal ideas can be presented quite concretely and explicitly in the ball, and one can quickly arrive at specific theorems of obvious interest. Once one has seen these in this simple context, it should be much easier to learn the more complicated machinery developed largely by Henkin and his co-workers that extends them to arbitrary strictly pseudoconvex domains. In some parts of the book, for instance in Chapters 14–16, it would however have been unnatural to confine our attention exclusively to the ball, and no significant simplifications would have resulted from such a restriction.

**Lectures on Hilbert Cube Manifolds** Thomas A. Chapman, 1976-12-31

The goal of these lectures is to present an introduction to the geometric topology of the Hilbert cube  $Q$  and separable metric manifolds modeled on  $Q$ , which are called here Hilbert cube manifolds or  $Q$  manifolds. In the past ten years there has been a great deal of research on  $Q$  and  $Q$  manifolds which is scattered throughout several papers in the literature. The author presents here a self-contained treatment of only a few of these results in the hope that it will stimulate further interest in this area. No new material is presented here and no attempt has been made to be complete. For example, the author has omitted the important theorem of Schori-West stating that the hyperspace of closed subsets of  $[0, 1]$  is homeomorphic to  $Q$ . In an appendix prepared independently by R. D. Anderson, D. W. Curtis, R. Schori, and G. Kozłowski, there is a list of problems which are of current interest. This includes problems on  $Q$  manifolds as well as manifolds modeled on various linear spaces. The reader is referred to this for a much broader perspective of the field. In the first four chapters the basic tools which are needed in all of the remaining chapters are presented. Beyond this, there seem to be at least two possible courses of action. The reader who is interested only in the triangulation and classification of  $Q$  manifolds should read straight through, avoiding only Chapter VI. In particular, the topological invariance of Whitehead torsion appears in Section 3.8. The reader who is interested in R. D. Edwards' recent proof that every ANR is a  $Q$  manifold factor should read the first four chapters and then, with the single exception of 26.1, skip over

Begehr, Francesco Nicolosi, 2009 International ISAAC International Society for Analysis its Applications and Computation Congresses have been held every second year since 1997 The proceedings report on a regular basis on the progresses of the field in recent years where the most active areas in analysis its applications and computation are covered Plenary lectures also highlight recent results This volume concentrates mainly on partial differential equations but also includes function spaces operator theory integral transforms and equations potential theory complex analysis and generalizations stochastic analysis inverse problems homogenization continuum mechanics mathematical biology and medicine With over 350 participants attending the congress the book comprises 140 papers from 211 authors The volume also serves for transferring personal information about the ISAAC and its members This volume includes citations for O Besov V Burenkov and R P Gilbert on the occasion of their anniversaries
