as *T. gondii*. The infection produces a wide range of clinical syndromes in humans and land and sea mammals and various bird species. Most humans contract toxoplasmosis by eating contaminated raw or undercooked meat, particularly pork, vegetables, or milk products, by coming into contact with the *T. gondii* eggs from cat feces, or by drinking contaminated water. The parasite damages the ocular and central nervous systems, causing behavioral and personality alterations, as well as fatal necrotizing encephalitis. It is especially dangerous for the fetus of an infected pregnant woman and for individuals with compromised immune systems, such as HIV-infected patients. Completely updated, the 2e presents recent advances driven by new information on the genetics and genomics of the pathogen. Provides the latest information concerning the epidemiology, diagnosis, treatment, and prevention of toxoplasmosis. Offers a single source reference for a wide range of scientists and physicians working with this pathogen, including parasitologists, cell and molecular biologists, veterinarians, neuroscientists, physicians, and food scientists.
